OK, why don’t we get started?

Welcome everyone to Cancer Center grand rounds. I’m Roy Herbst and I’m broadcasting here with Paula Pike from the North Haven Care Center, which is actually the home of the main campus. Thoracic oncology right now and today is going to be a very special presentation. ’cause I think there will be something for everyone. All the way from the clinic to the lab and back, and we’re going to actually have
00:00:36.690 --> 00:00:38.185 a relatively large panel where
00:00:38.185 --> 00:00:39.739 we’re going to hear from some
00:00:39.739 --> 00:00:41.430 of the members of the thoracic
00:00:41.430 --> 00:00:43.152 center and and get their thoughts.
00:00:43.160 --> 00:00:44.735 And there’s also some exciting
00:00:44.735 --> 00:00:46.310 breaking news on lung cancer
00:00:46.365 --> 00:00:47.697 for anyone who has a nap,
00:00:47.700 --> 00:00:49.856 they’ve probably seen the articles in the
00:00:49.856 --> 00:00:52.246 Times and other CNN just in the last hour,
00:00:52.250 --> 00:00:53.948 so we we knew about that.
00:00:53.950 --> 00:00:56.708 So we’re going to talk about that.
00:00:56.710 --> 00:00:57.403 So welcome everyone,
00:00:57.403 --> 00:00:59.399 I’m going to introduce the panel at the end,
00:00:59.400 --> 00:01:00.933 but I’m going to show a few
00:01:00.933 --> 00:01:02.527 slides just to get us warmed up.
I'm really excited to be here and I'm really just here. I'm in the conductor of an amazing orchestra of wonderful people that really make up the program that you're going to hear about today. That's been in existence for some time where we're just going to try to expand it out to even more places with the same expertise, caring quality that we've come to expect. So I'm going to talk about the lung, cancer, clinical care and research program, and I'm going to introduce the Thoracic Disease Center.
Something many of you have heard about in recent days. These are my disclosures. So we’re talking about lung cancer and lung cancer has an amazing burden worldwide, with over 2,000,000 cases worldwide, and 1.76 million deaths. Still, the number one cause of cancer death, perhaps more breast cancer or prostate cancer, are diagnosed skin cancer. For screening for lung cancer is still in the US. You can see 135 thousand plus deaths despite all the improvements you’re going to hear about today,
most of lung cancer, 84 percent is non small cell. The majority of the non small cell adenocarcinoma and more than half presents already metastatic. And that makes it even more difficult to treat. And of course, tobacco, the single largest preventable cause, leading to 30% of all cancer deaths there. About 20 cancers that you can track back to tobacco, but in those who are non smokers,
especially in lung cancer, you can see the potentially actionable mutations for which we now have drugs either in trial or for the most part as approved agents. What a change from 1520 years ago, and there are even data now for K wrasse targeted drugs will talk a little bit about that for those who have smoked. The adenocarcinoma is about 12% now have a target. Weather or twality for this disease is really improving and you can. You can see that here both
for men and for women.

This is the data from the American Cancer Society and the rate of lung cancer.

The incidence is decreasing by 2.6% a year and the mortality by 4.3%

One point, 2% incidents and three point 1% mortality.

This is the result I would contest of better prevention.

Primary prevention not smoking.

Secondary prevention.

You know the cat scanning will talk about that, but also some of the therapies.

Some of them that had their origins here with science and studies at Yale.

Well, here’s the history of
the Thoracic Oncology program,
and I’m a relative newcomer to some
of the group that’s been here.
Look in the bottom left and Lynn
really had the idea for this.
Working with Lynn Wilson and
my friend and many of yours.
The late John Urine,
and this is actually ground ham,
and so he was a great surgeon,
but he was not a thoracic. Only surgery.
Did cardio cardiac disease as well.
So Lynn got some money and had the
idea to recruit US thoracic surgery.
Specialist and build a section
00:04:38.155 --> 00:04:39.076 of thoracic surgery.
NOTE Confidence: 0.8338785
00:04:39.080 --> 00:04:41.816 And of course you recruited Frank.
NOTE Confidence: 0.8338785
00:04:41.820 --> 00:04:42.783 And that happened.
NOTE Confidence: 0.8338785
00:04:42.783 --> 00:04:43.746 Then you can.
NOTE Confidence: 0.8338785
00:04:43.750 --> 00:04:46.004 You can see that the group here.
NOTE Confidence: 0.8338785
00:04:46.010 --> 00:04:48.299 Then you can see the tip program
NOTE Confidence: 0.8338785
00:04:48.299 --> 00:04:50.507 that we've come to know and love.
NOTE Confidence: 0.8338785
00:04:50.510 --> 00:04:51.370 And John to Chomsky.
NOTE Confidence: 0.8338785
00:04:51.370 --> 00:04:53.291 And a team that can do interventional
NOTE Confidence: 0.8338785
00:04:53.291 --> 00:04:55.019 techniques along biorepository.
NOTE Confidence: 0.8338785
00:04:55.020 --> 00:04:56.952 Actually Lens set that up with
NOTE Confidence: 0.8338785
00:04:56.952 --> 00:04:57.918 Frank Susan main.
NOTE Confidence: 0.8338785
00:04:57.920 --> 00:04:59.630 Now one of the ranking members
NOTE Confidence: 0.8338785
00:04:59.630 --> 00:05:01.933 of the FDA with Susan was here
NOTE Confidence: 0.8338785
00:05:01.933 --> 00:05:03.389 working with Bonnie Gould,
NOTE Confidence: 0.8338785
00:05:03.390 --> 00:05:04.377 Rothberg, David rhyming,
Kurt Shopper if any of the scientists in the audience need tissue, we have it.

Then I came around 2011, about 10 years ago. Actually, exactly 10 years ago today, and you know, we work very hard to even build further, and we develop the yell spore in lung cancer. This is truly a team effort.

P50 the lung nodule screening program is a robust and going strong and here’s a recent retreat organized and you can see the numbers of people that are involved. This is truly a team effort.
And here you can see a bit of the evolution and you know people have aged quite gracefully. I think you know. So here is 2004. Now at the very origin Scott I just come know he’s done an amazing job. He came to work with John. John passed away in his first month with Scott, took on the Helmand, and he’s going to join me in a second. He’s dancing a patient and I’ll tell you about his early work in immunotherapy. Then, of course, here’s the group in 2008, already quite robust.
You know, building this doctor Decker. Then in 2012, this is the referral. First retreat that I helped organize. With with with Lynn and Frank and this was over there at the up on Prospect St. And then here’s our more recent group. Well, what I really want to talk to you about is multi modality care and how multi modality care makes a difference and that’s why we’re even working harder now to promote the thoracic center. So what you can see is you know there are so many aspects of multi modality care, including screening.
Pulmonologists radiologists, surgeons, medical oncologists social workers. Of course, the clinic administration the wonderful nursing and support staff. It really is a village and we had it all here. I can tell you, having worked at many great hospitals over the years, it’s all here expert care at all sites. Common practice patterns will do even having worked at many great hospitals over the years, it’s all here expert care at all sites. Common practice patterns will do even having worked at many great hospitals over the years, it’s all here expert care at all sites. And we’re just going to do more of that with this new iteration of the thoracic center.
Now thoracic research and I've given grand rounds that my team have given grand rounds. I just want to introduce that research can be basic. In the lab we have tons of that. Yeah, it’s the best in the world translation or the lab to the clinic. I think that’s the special sauce. Being able to take that back and forth. Of course to the clinic and clinical studies and not to forget outcomes in the community. You know we have proteomics. We have genomics right now. The key is community omics.
00:07:39.740 --> 00:07:41.630 We gotta get out to the community.
NOTE Confidence: 0.84947467
00:07:41.630 --> 00:07:42.980 We live in New Haven.
NOTE Confidence: 0.84947467
00:07:42.980 --> 00:07:45.196 We’ve gotta get out to the New Haven.
NOTE Confidence: 0.84947467
00:07:45.200 --> 00:07:47.750 Car door you’ve gotta get outta
NOTE Confidence: 0.84947467
00:07:47.750 --> 00:07:49.450 to Trumbull to Bridgeport.
NOTE Confidence: 0.84947467
00:07:49.450 --> 00:07:54.034 Up North we have to do all that.
NOTE Confidence: 0.84947467
00:07:54.040 --> 00:07:55.558 So what is the major accomplishments?
NOTE Confidence: 0.84947467
00:07:55.560 --> 00:07:59.054 Again, just a few.
NOTE Confidence: 0.84947467
00:07:57.650 --> 00:07:59.054 Immunotherapy Scotts get out.
NOTE Confidence: 0.84947467
00:07:59.054 --> 00:08:01.829 Hopefully arrive soon and tell us about this.
NOTE Confidence: 0.84947467
00:08:01.830 --> 00:08:02.574 You know,
NOTE Confidence: 0.84947467
00:08:02.574 --> 00:08:06.070 before I even knew Scott or a new bout.
NOTE Confidence: 0.84947467
00:08:06.070 --> 00:08:06.902 Yeah I.
NOTE Confidence: 0.84947467
00:08:06.902 --> 00:08:08.566 I heard about immunotherapy
NOTE Confidence: 0.84947467
00:08:08.566 --> 00:08:11.039 happening here with Marios Nolan and
NOTE Confidence: 0.84947467
00:08:11.039 --> 00:08:12.884 Harriet Kluger Scott taking over
the first or second patient ever
treated with lung cancer on a PD,
L1 and PD1 inhibitor here at yeah.
This woman three times refractory
to lung cancer,
squamous cell disease prognosis
here would have been months just
saw her couple of months ago.
10 plus years amazing.
This is the curve.
This is from Scott’s first study,
published this.
It’s one of the more cited papers
last year or two years ago in JCO.
Look at the tail of this curve.
Now we of course want to do better, and for anyone watching this and you’re thinking. Of course we have to do better, but five year overall actual survival comma. Sure this is 16%. This is the tale of the curve simply transformation ull. We have innovation. This is an investigator initiated trial. Very proud of this, this was a collaboration between the Melanoma group. They have a Sport 2 led by Harriet Cougar and part of that’s more as well, but this was a while back.
Sarah Goldberg and Veronica Chang, of course, who’s a neurosurgeon who does the Gamma knife? Here’s a patient with Brain Mets with with lung cancer who was going to be candidate for immunotherapy. We could have radiated the brain here and two weeks of radiation would have probably resulted in some cognitive impairment. But instead this patient was treated with immunotherapy, and in this very first study, it was shown that patients actually respond in the brain,
and this actually was before any of the clinical trials were allowing this and anyone was doing this in clinical practice, innovative and Carla studies from this, maybe Kurt will tell us a bit about that when we call on him. And papers again not meant to be in detail. I don’t want there is so many papers. One of the things we’re going to do as part of this new disease center is keep a full lot. Again, and quantify all these, but we’ve published it, builds the scientific literature. It helps get this to other places.
It builds our reputation.

Basic science, I'm actually. We have amazing basic science, just one of our sport projects.

Project 2 Katie and Sarah both here working with Mark Lemon from the Cancer Biology Institute. Mechanistic approaches to counter TKI resistance and easier from lung cancer. So here’s the team this.

I think this is in the library in the brain room working to develop their methods to counter EGFR resistance. Publishing well, changing the field we’ve had.
We have a long slow retreat here a few years ago that Katie ran with Christine. Lovely from Vanderbilt, this is what we need to do more of our continuing to bring the best science to bear on this disease. And then what about translational science? This is the area where I have put most of my time, but we built a lung spore. It took us a few years, but in 2015 we became only the third lung Spore. Here we are celebrating and then we renewed it on our very first try in 2020. Why?
Because we had impact in smoking cessation in immunotherapy and targeting EGFR resistance. And we continue to go strong. This is our current spore iteration. We have projects right now and you'll hear about this new new targets for immunotherapy. Everyone in the world is using Leaping’s first discovery. Now we’re working on one of his. Others were working on brain metastases with Don when a wonderful addition to this team, Katie and her team. As I mentioned, Sarah and Mark working on each year for a pathway resistance,
or continuing to look at prevention with smoking.

Is this trial Bentall and Lisa Fucito. And others, this trial Brenda and others is about to unveil its results.

These drugs and this is just the list I could think of. You know, in the last night when I was making the slide with Doctor Joe who helped me with these slides, you can see all these drugs. Their first uses. How to use them, the mechanism,
the biopsy studies all really with some origins here at Yale Cancer Center. Very proud of that. People could come here. I still recall with that as Alisme AB nine years ago. Patient coming from New York because they couldn’t get immunotherapy in New York that getting in here at Yale. I’d like to see us do more of that with the next generation of either targeted therapies or immuno therapies. And with surgical techniques and with other types of treatments. We have a dark eyed disease
align research team.

This is a picture from our last week's meeting. Some of the leaders will be on there. I guess I must have taken a phone call in the middle of the call and they caught me. Amazing amazing group of people. These are the people that make it happen. I hope I know many of them are watching and I appreciate their work so much and really fantastic and our leaders. Jennifer Pope incera public. Just amazing team. Accruals you know these are the
cruise without the phase one patients

'cause a lot of lung patients go to phase one but this has been pretty decent.

I would like to see this go higher.

How are we going to make this higher by bringing more patients here and by having more trials and being more efficient.

I'm not a skier.

If I was a skier, this would be the biggest slope I’d ever want to go on.

And I gotta tell you, we gotta fix this a little bit of a downturn last year.

Some of this is kovid.
the current environment,
but we're going to bring this up and this.
This is where our tissue samples come from.
This is our innovation.
This is how we help more patients.
But our trials are very nicely divided.
Very proud of this 40% or so of
our accruals are the care centers.
The lung team really is already
multidisciplinary and already
working between the care centers
and you can see while 37.8% are
industry were very active in the NCT.
with leadership in the in the swag.
Several of the group have
leadership committees.
Leadership position in the lung Committee that Decker has leadership myself and several others that Cappelletti and you can see investigator initiated trials. About 10% we’re going to do even more of those for the future. This just opened, I think Scott’s probably downstairs putting someone on so this is an investigator initiated trial with the drug cyclic 15. What does it mean? Investigator initiated Yell holds the Ind Yell is fully responsible for this trial.
We’re getting the drug from next cure.

A company that leaping has been involved with and we’re getting the.

Where the phase one studies were initially run and we’re getting.

The Pebble is a map from work, but we’re pulling out altogether.

We’re getting the biopsy. The biopsies will be picked up in the clinic by one of our team to go to David’s lab.

Will go to Kurt Slab.

Only pings lab.

This is how science has to be done.

The best treatments and then understanding the mechanism.

All that happening through the system.
Just to finish up, we have a wonderful program in small cell lung cancer. This is led by and Chang, you know, small cell is a community type disease. I think it’s one of the reasons why Anna smoking related to these two. Why we have so much care? Center accrual because some of her innovation with the care centers in this small cell program. And then lung cancer screening. I’m going to Clint Ocus in a bit but this is just been a phenomenal labor of love from Lynn and the team to get screening at multiple sites.
And again it couldn’t be more timely. Cousins going to tell us a little bit about how screening is not only being done but it’s being expanded. Community outreach and engagement. I mentioned that you know our lung map trial. Here I am with Doctor Joe talking to the Cultural Ambassadors the way you get trials out to the community. as you go to the community, you talk on the radio programs. You go to. The churches were doing that. You were donating masks were creating. Navigators were going to do more of this. Now we have a network no, I mentioned. I’m here 10 years ago.
Little bit more than nine years ago we brought in the first group Mo H 21 doctors. Now we have 15 sites where care can be delivered. I believe this is Westerly RI. Be nice to have a boat so look at all these sites that we have and we need to now expand and deliver multi modality care innovative care, protocol driven care or at least the best standard of care at all these sites. We're doing that, but we're going to do it even better as we expand.
I’ve known since I got here, who’s done so much for this endeavor, has spoken to this group before about the disease centers, pulling together things into a clinical research and education component, and inclusivity, cons of the wheel or working together. I’m not going to go into this into much detail except to say thank you, Kevin, because you gave us the resources and the stimulus to take lung cancer to this level. So now we have our cabinet and by the way, this is no way to mean that if
you're not listed on the cabinet, you're not critical.
They're going to work. Streams are going to be subgroups, but this is just the start. As we launch this, I've agreed.
I have plenty else to do, but I'm passionate about this. I think as you all know, and I can work all the different areas.
I'm going to be the coordinator for now, and I'm starting out as a coordinator, but Dan Boffa remains the clinical director. He's doing amazing job with this Scott. Get challengers,
Our Chief of Thoracic Medical Oncology is Sarah Goldberg, who will be the research director, and Katie Poletti, the scientific director. They work very closely with Kevin and the administrative staff, and this cabinet is meant to represent different disciplines and centers. Vinny is at Bridgeport and I'm going to introduce them all in just one moment.

So here's our panel. I did what I wanted to do in 20 minutes. I've invited all this group to be here today.
It’s a new way to doing to do grand rounds, but having been on most of the grand rounds the last year I missed the interactive format. I think it would be interesting to see plenty of questions. I’m going to ask each of these panelists to be careful with their time. Ask them one to introduce himself. To tell them to tell us what they do and then tell us a little bit of something that’s really exciting in your area and perhaps how you think we can bring that to the disease center. Thoracic disease center.
throughout Connecticut.

So with that, I think I’ll stop.

I just went over knowledge.

We have so much support from the team, but also philanthropy.

This is all philanthropy that comes to lung cancer.

More on the way I hope.

And we have peer reviewed funding as well.

So I don’t let me see if Lynn is on the line.

Lynn’s not here yet, so.

After sort of do a Bayesian approach here.

Lynn’s not here yet, so.

So let me stop sharing.

And I’m going to put the screen up and let me ask the panel members to unmute and welcome you all,
and thanks for being here. I guess maybe that the first word I’d like to introduce is Dan Boffa, Dan Lynn’s about to be here, and I want to save the screening discussion for her. Can you just introduce yourself? Tell us a little bit about some of the innovations in surgery and why multimodality care is so important. Sure, thanks Roy. So for those of you who don’t know,
I’m one of the thoracic surgeons and. There have been a number of innovations in surgery that really tie to care delivery in general that one of our research interests in the division of Thoracic Surgery has been networks and how networks can function better to provide care. We’ve really identified a number of opportunities where satellites are not performing at the same levels as the main campus, and we believe we’ve discovered several ways to improve that. The things that I so I’ve,
I've served as the clinical director of top, and I think that moving into the next chapter is how do we bring? Our multidisciplinary care model to other centers across the network and and I really tried to image what does care, feel like across the network. You know it and really just comes down to care. Really needs to feel like it’s connected so that all of our centers are connected and all of our clinicians are connected. Care has to feel navigated and we’ve totally revamped our entire nursing model so that we now have practice nurses.
We've essentially doubled the number of practice nurses across the threats, conchology program, and so that really, there's going to be somebody holding your hand that’s identifiable throughout your entire cancer journey. And when there’s a handoff across modalities, it’ll be to somebody who’s on that team. And finally, it’s gotta be expert care. You know there’s experts in clinical trials. There’s experts in complex surgery. Need to be experts.
not just the tough parts, but the general well being.
And so we're trying to refine what it feels like to be a patient in the thoracic oncology program.
Throughout the entire journey.
So what are some of the innovations we hear about robotic surgery, vats, surgery, different techniques or are we using that throughout our system? Yeah, they actually.
The right now three of the six, So all of the surgeons do minimally invasive surgery.
we’re going to 7 in July.

Three of the six do robotics,

but by by hopefully by

December or January next year.

Five of the six will be doing robotics,

but everything is done.

You know, we do.

The vast majority of things

minimally invasive Lee.

Um? You know,

we’re trying to grow bigger,

but we’re also trying to grow

safer and try to grow stronger.

And so believe the the robotics

platform is an important part of that.

It’s.
But I also think that maintaining the principles of oncology and in doing complete resections safely.

You know that’s where the and matching people with the most appropriate treatment to their goals of care.

I mean, that’s really where the art and science. Come together.

Thanks Dan and will get back to you in a bit Lynn.

I thanks for joining so I hope your ears were burning so I showed some of those slides you you loan me about the origins of...
top and actually was fortunate.

I met Lynn about 20 years ago when I first came through and visited Yale and then actually one key hiding my mentor who is a very strong advocate, unfortunately passed away a few years ago of prevention. We know we talked, we actually met for a summer to talk about prevention efforts. So then I thought you could introduce yourself. Say a few words about what you do, but there was some news within the last hour on lung cancer screening, so I did show your first slide show.
The second slide.

I can put it up if you want, but tell us what’s so exciting.

It’s in the New York Times right now as we speak.

So as of 11:00 o’clock this morning, the United States Preventive Services Task Force revised its recommendations for lung cancer screening.

So Roy, if you could put up the slide, Paul is going to help me here.

And so if you already showed this slide I had, you know that we’ve been screening on
the basis of the eligibility criteria

of the national lung screening trial, which occurred back in 2011.

Unfortunately CMS dinner.

Really, with the help of policy there, who is the nurse coordinator for cancer screening program?

We've really taken off an this new recommendation had been out for public comment last summer and there was a great deal of controversy about expanding the eligibility criteria.

But the bottom line is after that period of open comment, the new recommendations are to screen people who are ages 50 to 80,
so they’ve decreased the entry age from 55 to 50 and with at least 20 pack years of smoking. And that recommendation really was based on the Nelson screening trial that was done in Europe and this much more aligns with the eligibility that was done in Europe and this much more aligns with the eligibility for that trial which was broader than the national screening trial. You still have to be currently smoking or have quit within the past 15 years which is came out of the NOST.
number of people eligible for lung cancer screening in the US is going to double from about 8 to 9 million to 16 to 18 million people, and one of the big push is behind the expansion of the eligibility criteria. Was that both and LST and the Nelson study showed that there was actually benefit for everyone but more benefit for women and minority groups sent for us, that’s you know. People who are African American and there’s a lot of debate. Still as to whether women Anne, certain minority groups,
00:26:10.758 --> 00:26:12.096 including African Americans,
NOTE Confidence: 0.8483535
00:26:12.100 --> 00:26:14.900 are more susceptible to lung.
NOTE Confidence: 0.8483535
00:26:14.900 --> 00:26:16.760 Carcinogenesis from cigarette smoke,
NOTE Confidence: 0.8483535
00:26:16.760 --> 00:26:20.056 but it is clear that those groups
NOTE Confidence: 0.8483535
00:26:20.056 --> 00:26:22.196 benefit more than other groups
NOTE Confidence: 0.8483535
00:26:22.196 --> 00:26:25.093 when you screen them and the whole
NOTE Confidence: 0.8483535
00:26:25.093 --> 00:26:27.307 point of lung cancer screening is
NOTE Confidence: 0.8483535
00:26:27.307 --> 00:26:29.820 to find people early because early
NOTE Confidence: 0.8483535
00:26:29.820 --> 00:26:32.370 detection means better chance of cure.
NOTE Confidence: 0.8483535
00:26:32.370 --> 00:26:34.922 It also lets us have a chance to
NOTE Confidence: 0.8483535
00:26:34.922 --> 00:26:37.433 talk to those people about smoking
NOTE Confidence: 0.8483535
00:26:37.433 --> 00:26:40.115 cessation which is a big part
NOTE Confidence: 0.8483535
00:26:40.198 --> 00:26:42.858 of the decision support visit
NOTE Confidence: 0.8483535
00:26:42.858 --> 00:26:44.986 that’s mandatory before every.
NOTE Confidence: 0.8483535
00:26:44.990 --> 00:26:47.048 Before the 1st initial Screening Study,
Having had the chance to cover for Poly, recently Anne and talk to 8 people. One day about tobacco cessation, and one of them quit on the basis of that, I think that that’s a huge opportunity that actually will be expanded as well because of the change in the screening criteria. So we’re pretty excited about that. That’s going to be a huge amount of work. We have some time before CNS approves that, but CNS will approve it. Recommended it, so we’re going to be gearing up right? Well, listen it all about access.
then people need to have access to get this done and they have to have insurance or CNS coverage, so hopefully this will help with that. How have we done this past year with Covid? We continue to screen a lot of patience. so everything shut down outpatient for a few months, but after that Poly we open screening at Young Haven, doing it, doing the decision support visits remotely, and so we’ve been meeting across the system with the screening program at Lawrence, which is very well established. Run by Lou Massarelli.
00:27:53.174 --> 00:27:55.460 Vinny Mazes has got the program
NOTE Confidence: 0.7934001
00:27:55.533 --> 00:27:57.578 at Bridgeport up and running,
NOTE Confidence: 0.7934001
00:27:57.580 --> 00:27:59.160 and there’s they’re starting
NOTE Confidence: 0.7934001
00:27:59.160 --> 00:28:00.740 to accrue screening population,
NOTE Confidence: 0.7934001
00:28:00.740 --> 00:28:02.320 and Greenwich is still
NOTE Confidence: 0.7934001
00:28:02.320 --> 00:28:03.900 in the planning process,
NOTE Confidence: 0.7934001
00:28:03.900 --> 00:28:06.770 but has a nurse coordinator.
NOTE Confidence: 0.7934001
00:28:06.770 --> 00:28:09.484 And so I think we can standardize something.
NOTE Confidence: 0.7934001
00:28:09.484 --> 00:28:11.860 Some of this is regional specific because
NOTE Confidence: 0.7934001
00:28:11.860 --> 00:28:14.226 of the way that the community practices,
NOTE Confidence: 0.7934001
00:28:14.230 --> 00:28:16.150 but it’s been great to actually
NOTE Confidence: 0.7934001
00:28:16.150 --> 00:28:18.212 all get together and talk about
NOTE Confidence: 0.7934001
00:28:18.212 --> 00:28:19.648 what we can standardize,
NOTE Confidence: 0.7934001
00:28:19.650 --> 00:28:21.010 what our goals are,
NOTE Confidence: 0.7934001
00:28:21.010 --> 00:28:23.042 you know, to have the nurse
NOTE Confidence: 0.7934001
00:28:23.042 --> 00:28:24.056 coordinators working together.
I think this is really going to accelerate things we’ve been screening at Yale, New Haven between 4 and 600 people a year. Um and we are working really hard to try to acquire or develop an epic tracking system that will allow us to actually keep track of all these hundreds of people. Actually a couple thousand at this point that we’ve accumulated and we want to be sure that we follow properly. That’s great, you know, as much as we have these new targeted therapies and immunotherapy’s preventing lung cancer or catching it.
00:28:56.202 --> 00:28:57.980 early will help so many more people.
NOTE Confidence: 0.81494343
00:28:57.980 --> 00:28:59.525 And actually maze surgery or
NOTE Confidence: 0.81494343
00:28:59.525 --> 00:29:01.070 surgery and then chemo radiation.
NOTE Confidence: 0.81494343
00:29:01.070 --> 00:29:02.342 But first with surgery,
NOTE Confidence: 0.81494343
00:29:02.342 --> 00:29:04.780 tell us a little bit what you do.
NOTE Confidence: 0.81494343
00:29:04.780 --> 00:29:06.508 You’re at Bridgeport and actually so
NOTE Confidence: 0.81494343
00:29:06.508 --> 00:29:08.489 you have an amazing screening talk.
NOTE Confidence: 0.81494343
00:29:08.490 --> 00:29:10.398 A few months ago so you
NOTE Confidence: 0.81494343
00:29:10.398 --> 00:29:11.890 obviously doing a lot of
NOTE Confidence: 0.81494343
00:29:11.890 --> 00:29:14.046 it there. Yeah no thanks allot you
NOTE Confidence: 0.81494343
00:29:14.046 --> 00:29:16.524 asked to talk about the Four WS, what,
NOTE Confidence: 0.81494343
00:29:16.524 --> 00:29:18.686 where and why. I’m Vinny, you know,
NOTE Confidence: 0.81494343
00:29:18.686 --> 00:29:21.386 I’m one of the thoracic surgeons, one of 6/2.
NOTE Confidence: 0.81494343
00:29:21.386 --> 00:29:24.592 Soon to be 7 like Dan talked about and I’m
NOTE Confidence: 0.81494343
00:29:24.592 --> 00:29:27.301 the site director for thoracic surgery at
NOTE Confidence: 0.81494343
00:29:27.380 --> 00:29:30.054 the You know Bridgeport Park Ave area.
Been on the staff now for three years and really appreciate the opportunity to expand. I think you know one of the exciting things that you talked about. Roy was. You know it’s about, you know, being present and that it takes a village and I think that’s one of the things that is exciting. As we expand. You know at Bridgeport it’s understanding the regional differences. But also how do we continue to deliver the same standard of care at
Bridgeport Park Ave is exactly the same like it is with in New Haven, New Haven County or at York Street. And that’s been a source of many discussions and we, you know, we work to achieve that, and that’s one of the exciting things that as we continue to expand at Bridgeport, we’re starting to roll out the enhanced recovery after surgery, which was started at York Street. We started off with a small lung cancer steering committee. And we’re going to start rolling that out at Bridgeport here this summer and the lung cancer screening started off. We started off with a small lung cancer steering committee.
Um, about three years ago, and you know, there was about 10 people that were screened, and now we’re up to about 100, so it’s going to grow quite quickly.

Well, thanks, Vinny, and you know the multi modality care is so important. Justin white. Tell us where you are and why is multi modality care so important and what is the importance of tumor board and all working together in this way?
00:31:01.270 --> 00:31:03.080 Thanks for having me Justin
NOTE Confidence: 0.81839705
00:31:03.080 --> 00:31:04.166 Blasberg thoracic surgery.
NOTE Confidence: 0.81839705
00:31:04.170 --> 00:31:06.954 I work for Vinny and Dan with Vinny
NOTE Confidence: 0.81839705
00:31:06.954 --> 00:31:09.596 and Dan and Fort Vinny and Dan.
NOTE Confidence: 0.81839705
00:31:09.600 --> 00:31:11.766 I’ve been at Greenwich since
NOTE Confidence: 0.81839705
00:31:11.770 --> 00:31:13.576 the beginning of the year,
NOTE Confidence: 0.81839705
00:31:13.576 --> 00:31:15.028 and like Vinny said,
NOTE Confidence: 0.81839705
00:31:15.030 --> 00:31:16.945 we’ve been working towards bringing
NOTE Confidence: 0.81839705
00:31:16.945 --> 00:31:19.672 our standard of the New Haven campus
NOTE Confidence: 0.81839705
00:31:19.672 --> 00:31:22.262 across the network and Vinny’s done a
NOTE Confidence: 0.81839705
00:31:22.262 --> 00:31:24.612 really good job doing that over the
NOTE Confidence: 0.81839705
00:31:24.612 --> 00:31:27.614 past couple of years and my goal at
NOTE Confidence: 0.81839705
00:31:27.614 --> 00:31:30.200 Greenwich is to mirror that success.
NOTE Confidence: 0.81839705
00:31:30.200 --> 00:31:31.385 On all fronts,
NOTE Confidence: 0.81839705
00:31:31.385 --> 00:31:33.365 including an ear *** protocol.
NOTE Confidence: 0.81839705
00:31:33.365 --> 00:31:35.340 Developing lung cancer screening program,
brining robust robotic surgery to Greenwich, which granted already has that capability but will be able to sort our expertise to that campus, which is great for patients and then also our multi disciplinary clinics similar to what we have in this sort of the New Haven campus. There’s a critical mass there of thoracic support, both a sunley for medical oncology. And others from radiation oncology and an opportunity for us to see patients in a common space and talk.
about multi modal approaches to treating patients with either early stage or local regional disease. And so all of those tools are in place at Greenwich. And it’s an exciting opportunity for us to treat patients there as if they were on the New Haven campus or the Bridgeport campus. But it’s amazing. We have surgeons, medical oncologists across all the campuses and of course radiation oncology. And when I call in all radiation oncologist Roy Decker and when I first got here I used to fall asleep at tumor board and they really were you thinking.
Oh boy but fortunately was Leroy Decker. They were asking opinion of so Roy tell us a little bit about radiation oncology. What's exciting new techniques and I know you also have another role in clinical trials. We'll get to that later.

So I have to say first Thanks, Roy. And when Roy and I see each other in the hallway we say hi Roy Roy and it has not stopped being funny yet so I just keeps on going. So I'm right Decker. I've been here many many years now there were two of us Lynn Wilson and I.
were the thoracic radiation oncologist. When top was born and we now have a large network of fantastic thoracic providers that serve. All of our sites, and I’ve recently turned over the clinical leadership of thoracic radiation oncology to Henry Park was not able to be here today, but Henry is done really an amazing job in creating a cohesive thoracic radiation unit that can offer all of our new technology and all of our exciting treatments at all of our sites in a very uniform fashion. And so I give him a lot of credit for that.
I am very excited to work with this group and I always have been. It has grown so amazingly over the last decade or more that it quite honestly is difficult to keep up with. I remember we used to have discussions about what day the rest that clinic was, and I believe we are now a five day week operation so it’s pretty exciting.

Right, one of these protons I hear about it carbon and everyone wants the newest techniques. Are we moving towards any of those and are they better or do they need studies?
Yeah, so we are moving forward with a couple of new technologies so we are hoping to build a proton center that will serve our network. It will be a smaller proton unit, but it may benefit some of our lung cancer patients. So far, trials have not shown a huge benefit to protons in lung cancer, at least not for all patients. But we think there may be a subset of patients that could benefit, and this is, you know, an enormous investment on the part of the hospital and several of our partners,
and we're excited to watch it grow. It's probably going to be 2 years before we treat a patient. You know, we're also exploring other new technologies like biologically guided radiation therapy that will be very useful in the treatment of patients with. Honestly, there's still exciting things coming from us. An excellent well let's take a little bit of a different tack. I'm going to get everyone but Katie Poletti know one of the reasons.
why I think were so strong on this long program with spores and stand up for cancer grants and more are ones that I can even count to press. Katie, you’ve been here over 10 years and really has formed the basis. You know with many other scientists but is now our scientific Director and Katie, we’ve really seen the science of lung cancer grow. I know when when I went into this field 2025 years ago, no one wanted to work in this field, but. Anything, breakthroughs and only this field 2025 years ago, no one wanted to work in this field, but. Anything, breakthroughs and only we only have a few minutes, but what’s exciting about the science
and how are you working to bring the science from the lab to the clinic and in your role as the basic science leader?

Yes, thank you very much Roy. So I’m Katie politi. I’m a cancer biologist and have been at Yale for almost 11 years now in the Department of Pathology and a medical oncology, and my laboratory focuses on understanding mechanisms of tumor initiation, progression, and the biology of lung cancer, as well as understanding sensitivity and resistance to different therapies in the disease.
And I think that there are a lot of amazing things that we have seen developed. Over the years in lung cancer, we have amazing science that is happening in these different areas that are really making a difference in taking our findings in the lab and moving them to the clinic and then taking them into the community as well. And that goes from the identification of new targets for lung cancer therapy, whether they be targets that are inside the cell, like EGF receptor for example.
another oncogenic drivers or carass for example in the cell, but also that are tumor cell extrinsic. So targets in the micro environment and we have. You heard about this new next cure trial, for example, from Roy. That is an example of that. We also have a lot of groundbreaking studies in modeling lung cancer, so developing new and better models to study the biology of lung cancer and to study sensitivity and resistance to therapy. And again, this goes from really developing refined,
genetically engineered mouse models,

For example,

the immune interactions between cancer cells and immune cells,

with some of the pioneering work from various different groups here,

like Nick Joshi like Leaping Chan like Richard Flavelle and others

and also then to the development of models that can be used to really study the disease in patients.

So patients arrived models where we can really study what is
happening in those human tumors. And understand the biology of the disease in those contexts, and so with these different models, we can leverage them then to study mechanisms of sensitivity and of resistance to therapy and really get to some of these very difficult issues that are being faced by patients in the clinic. And so I think that those are just some examples of areas and things of work that is ongoing here at Yale, and I think this is a great place to really bring together
Because of the really good size that we have of Yale. So at Yale where we have. The big clinical enterprise, but it’s very, very connected also to the scientific enterprise, and so this is a really remarkable opportunity to bring everybody together and leverage the the infrastructure that is being developed through resources like this for example, other projects that are happening here at Yale. Like the Generations Project,
which is focused on germline sequencing in people individuals.
For example the development of models and bringing these altogether.
We're going to really work hard to leverage that and bring the science to the clinic.
Thanks Katie, it's great to have worked with you and all of us.
worked with you and all of us.
I appreciate that.
But now we're going to really transform things even more.
Scott Scott’s just up from clinic I talked about.
You already tell us about.
You're here and how long are you at your now? You're on the screen. I've been here longer than most of you, Lynn's been here longer, but over 15 years, and I've certainly seen dramatic change in our loan program. Great, now is that everyone sort of come together and then it's raster program. I think we're great model for other cancer groups because we have basic scientists are working with us. We have clinicians. We have things. We have all sorts of people working
on the same same projects for me.

My problem, my primary responsibility is treating my patients and we certainly have a good amount of patience and my second responsibility is to learn from my patients and to try to understand who responds and who doesn’t respond so we can extend responses to all of our patients and for me, I do this with all of you primarily with Katie Palladian. I we have a protocol where we we aggressively biopsy patients their tumors, their blood sites of toxicity, surrender stand. Who’s responding?
Why someone gets the toxicity to improve upon. What we have now and. I can tell you that from we have patients from early trials who are doing incredibly well now with immunotherapy’s 10 years and plus how some people have never heard of. So my focus right now is to understand those patients. Why does a patient who has a prognosis of three months live 10 years without any evidence of disease, and hopefully another 10 years? Why can’t we do that for all of our patients and with the help
NOTE Confidence: 0.809984
00:41:31.590 --> 00:41:33.060 of Katie and everyone else,
NOTE Confidence: 0.809984
00:41:33.060 --> 00:41:36.000 we’re trying to get to that let me ask you,
NOTE Confidence: 0.809984
00:41:36.000 --> 00:41:37.470 you’ve been here. You recruited,
NOTE Confidence: 0.809984
00:41:37.470 --> 00:41:38.662 probably Wilson was director.
NOTE Confidence: 0.809984
00:41:38.662 --> 00:41:39.556 Eddie Chu yeah.
NOTE Confidence: 0.809984
00:41:39.560 --> 00:41:42.071 So tell me how did you get that first
NOTE Confidence: 0.809984
00:41:42.071 --> 00:41:44.475 trial with Nivo Map was a trial that was
NOTE Confidence: 0.809984
00:41:44.475 --> 00:41:46.376 being run with Mario tells the story.
NOTE Confidence: 0.809984
00:41:46.380 --> 00:41:47.512 It’s pretty exciting, no.
NOTE Confidence: 0.809984
00:41:47.512 --> 00:41:50.209 So so I have my office is no Hall with
NOTE Confidence: 0.809984
00:41:50.209 --> 00:41:54.022 Mario Show who’s really a giant when it
NOTE Confidence: 0.76924354
00:41:52.390 --> 00:41:54.022 comes to immuno therapies for cancer
NOTE Confidence: 0.76924354
00:41:54.022 --> 00:41:56.468 and he one day just knocked on my door.
NOTE Confidence: 0.76924354
00:41:56.468 --> 00:41:58.330 Since I got this trial of this
NOTE Confidence: 0.76924354
00:41:58.396 --> 00:42:00.546 drug MDX 1106 and I said what is
NOTE Confidence: 0.76924354
Mario 'cause we certainly need things for our patients, he said.

It's an immunotherapy and I said Mario, don’t you know?

Immunotherapy doesn’t work for lung cancer?

We’ve been doing it for decades. All the trials are negative and Mary said just just believe me,

A different type of immunotherapy.

So we put a few patients on and the first thing I noticed was that these patients were tolerating therapies incredibly well. Most of patients back then were
00:42:23.210 --> 00:42:24.560 going on phase one trials,
NOTE Confidence: 0.83357674
00:42:24.560 --> 00:42:25.632 which were very harsh.
NOTE Confidence: 0.83357674
00:42:25.632 --> 00:42:26.704 You know combinations of
NOTE Confidence: 0.83357674
00:42:26.710 --> 00:42:27.778 chemotherapy and targeted therapies.
NOTE Confidence: 0.83357674
00:42:27.780 --> 00:42:29.125 The first thing these patients
NOTE Confidence: 0.83357674
00:42:29.125 --> 00:42:30.470 really where we’re having detriment
NOTE Confidence: 0.83357674
00:42:30.470 --> 00:42:31.820 in their quality of life.
NOTE Confidence: 0.83357674
00:42:31.820 --> 00:42:33.698 And then we started seeing the responses.
NOTE Confidence: 0.83357674
00:42:35.584 --> 00:42:35.584 That was about 10 years ago and
NOTE Confidence: 0.83357674
00:42:35.584 --> 00:42:37.200 we still a patient from that
NOTE Confidence: 0.83357674
00:42:37.200 --> 00:42:38.280 first trial who are
NOTE Confidence: 0.83357674
00:42:38.280 --> 00:42:39.888 doing well after finishing their course
NOTE Confidence: 0.83357674
00:42:39.888 --> 00:42:42.082 of therapy over a year or two now.
NOTE Confidence: 0.83357674
00:42:42.082 --> 00:42:44.210 8-9 years later,
NOTE Confidence: 0.83357674
00:42:44.210 --> 00:42:44.210 without any evidence of cancer,
NOTE Confidence: 0.83357674
so I attribute that to Mario, who introduced me. And then from there it was easy with what we needed to do. I still remember going to Scott’s office when I was interviewing here. Can you show me some of those films and? Again, they were not doing this at MD Anderson. They were not doing this at memorial back. Bring it here to my board every week. We have a tumor board. We probably need more of them as we expand. We look at radio radiology. Isabel so you have a hard job. In fact, we hit you with like 20
cases on a Friday and you have to look at all the films on the weekend. You and your team tell us a little bit who you are, what you do and tell us about radiology in lung cancer.

Thank you for having me here. I miss about quarter past. See, I've the section chief of Thoracic Imaging here at Yale. First started here in 2010 when working with Lee and Anne back then with Amanda and.
of lung cancer screening,

there was challenging, so I think we have been involved in all aspects in terms of thoracic malignancies,

We work closely together with laying with the surgeons with Frank on their screening.

We provide the reports in a way that can help declination with the lung RADS evaluation.

We also have worked a lot on incidental findings which was a big problem when you first start scanning.

A lot of people you see all the other things thyroid nodule adrenal nodule.
Coronary calcium and what to do with those? So we try to implement that on our report to guide their referring physicians who may not know what the next step would be. We have been expanding the lung cancer screening as well, together with that special clinical to trying to reach more and more sites. We started here. I think we evolved a lot when in Mar imaging of thoracic malignancies as well. Since 2010 we have been applying more MRI for mediastinal tumors in.
characterizing anterior mediastinal, particularly thymoma, and versus dynamic hyperplasia, or the differentials before surgical excision. We had recently start looking at MRI, the ability to assess post radiation changes in lung cancer, in combination with pets, so there is a lot of research going on that as well. If you can be better or complementary to pet City, which is hard with. All the information for radiation and
the other area that mean radiology is always quickly evolving. We have a lot of machine learning artificial intelligence. One of the fields that we think could be applied is that. As Scott, without some patients get document the immunotherapy or the therapy and they get progression on imaging. But later on you go back and was actually pseudo progression. So we're trying to see if we can come up with machine learning model. They can analyze additional texture analysis of.
00:45:49.000 --> 00:45:51.758 these cancers on that city that our
NOTE Confidence: 0.82432306
00:45:51.758 --> 00:45:55.100 eyes cannot do an if we can try to
NOTE Confidence: 0.82432306
00:45:55.100 --> 00:45:56.660 differentiate pseudo progression versus
NOTE Confidence: 0.82432306
00:45:56.660 --> 00:45:58.879 true progression early on in therapy.
NOTE Confidence: 0.79031104
00:45:59.630 --> 00:46:00.894 Always about, you know.
NOTE Confidence: 0.79031104
00:46:00.894 --> 00:46:02.474 Expertise in radiology across the
NOTE Confidence: 0.79031104
00:46:02.474 --> 00:46:04.050 whole network is is critical and
NOTE Confidence: 0.79031104
00:46:04.050 --> 00:46:05.859 we have a tumor board every week.
NOTE Confidence: 0.79031104
00:46:05.860 --> 00:46:08.398 As I said, Rob Homer is a constant there.
NOTE Confidence: 0.79031104
00:46:08.400 --> 00:46:10.098 Looking at that issue you’ve been
NOTE Confidence: 0.79031104
00:46:10.098 --> 00:46:11.799 doing this since I’ve been here.
NOTE Confidence: 0.79031104
00:46:11.800 --> 00:46:13.768 Robin and will have Kurt Chopard speak a
NOTE Confidence: 0.79031104
00:46:13.768 --> 00:46:15.759 little bit about more research pathology,
NOTE Confidence: 0.79031104
00:46:15.760 --> 00:46:16.892 but tell us, Rob,
NOTE Confidence: 0.79031104
00:46:16.892 --> 00:46:18.590 you know what is your role.
NOTE Confidence: 0.79031104
00:46:18.590 --> 00:46:20.445 So you do you review all the
Before we treat before we make a diagnosis here? Even if it’s from the outside. First of all, I wanna thank you for letting me talk today. That’s really great. Lynn Tanui, I have the old folks. I’ve only been in jail since for 42 years, so not here my whole life. But so far so the role pathology really is sort of central to the whole process. Everything sort of narrows down through the you know, the eyes of some histopathologist somewhere. It’s actually make a diagnosis.
So clearly I represent a lot of people behind me. It's like. There's a lot of people in not just at Yale, but at other places. Cytology, other his pathologists. And so you know the case of the wind up in tumor board course. Do most of those go through some pathologist? I might may not review all of them. Certainly any cases that are little unusual or exceptional. I've tried to put my eyes on and I know that pathology language is not English, right? It's sort of funny language,
and so there's a certain amount of interpretation that needs to go in. And a little bit of spin to help explain, because some things are very straightforward, somethings not so much. So of course, the other things we're looking forward to in terms of what's new, what we're excited about. Small cell is really kind of been sort of. Not much going on with it for forever, Not much going on with it for forever, and we're kind of excited that subsets and we're kind of excited that subsets of small cells sort of shown up. I've been involved in a little bit of that. I expect that we're going to be
giving that up into something more, hopefully more approachable, and in terms of the Department. You know, we’ve moved. We had used a relatively small panel from most lung cancers. Now we’ve sort of moved to a much larger panel for a. Of genetic abnormalities that we can do on a routine basis, which is great, and with the assistance of the new chair of the Chen and the hospital. We’re hoping to move digital pathology into the features so we
00:48:13.176 --> 00:48:14.954 can actually do a better job of sharing images across the network.
00:48:14.954 --> 00:48:16.499 You know, moving physical pieces of glass around seems very antiquated and hopefully we're going to sort of move forward in that.
00:48:18.812 --> 00:48:20.600 And that's really going to open up, in the same way that Isabel talked about digital image analysis,
00:48:20.600 --> 00:48:23.198 or. In a computer assisted work for radiology,
00:48:23.200 --> 00:48:24.650 you know, that's really going to start
00:48:35.132 --> 00:48:37.289 doing the same thing for pathology images,
NOTE Confidence: 0.79031104
00:48:37.290 --> 00:48:38.904 which we hope to get to
NOTE Confidence: 0.79031104
00:48:38.904 --> 00:48:40.390 at some point as well.
NOTE Confidence: 0.79029346
00:48:41.160 --> 00:48:42.630 Yep, thanks Robin for everything
NOTE Confidence: 0.79029346
00:48:42.630 --> 00:48:44.600 you do and it’s good to know.
NOTE Confidence: 0.79029346
00:48:44.600 --> 00:48:46.896 Every Monday morning we might not be there,
NOTE Confidence: 0.79029346
00:48:46.900 --> 00:48:49.196 but you’re there and and you know really,
NOTE Confidence: 0.79029346
00:48:49.200 --> 00:48:50.660 keeping the tumor board running
NOTE Confidence: 0.79029346
00:48:50.660 --> 00:48:52.639 and no will do more of that.
NOTE Confidence: 0.79029346
00:48:52.640 --> 00:48:54.544 So you know when I when I
NOTE Confidence: 0.79029346
00:48:54.544 --> 00:48:56.370 came here to build us for,
NOTE Confidence: 0.79029346
00:48:56.370 --> 00:48:57.810 it’s really based on tissue.
NOTE Confidence: 0.79029346
00:48:57.810 --> 00:48:58.668 Yeah, strong statistician.
NOTE Confidence: 0.79029346
00:48:58.668 --> 00:49:00.384 You of course need a science.
NOTE Confidence: 0.79029346
00:49:00.390 --> 00:49:02.094 So I was fortunate to meet
NOTE Confidence: 0.79029346
00:49:02.094 --> 00:49:03.550 David Rim in David Rim.
93
As you all know, is involved in all the sports here at Yellow Three. Now they all rely on David and David. Still very involved with us but. Um, what is it? Current 4-5 years ago, he said, I’ve got this this guy in my lab is great. We’ve got to keep him here. I don’t want to go back to Chile and he did it, and that skirt shopper in Kurt’s just been a wonderful collaborator or scientifically and therapeutically in his lab and the Corps ’cause you gotta, you gotta collect that issue and
00:49:29.140 --> 00:49:30.947 get it in the right place and
NOTE Confidence: 0.79029346
00:49:30.947 --> 00:49:32.739 get it from all these centers so
NOTE Confidence: 0.79029346
00:49:32.794 --> 00:49:34.621 Kurt tell us a little bit about
NOTE Confidence: 0.79029346
00:49:34.621 --> 00:49:36.156 yourself and what you do.
NOTE Confidence: 0.79029346
00:49:36.156 --> 00:49:38.394 And thanks for being here today.
NOTE Confidence: 0.79029346
00:49:38.400 --> 00:49:38.720 Thanks
NOTE Confidence: 0.78116035
00:49:38.720 --> 00:49:40.310 Roy. So I’m Kurt chopper.
NOTE Confidence: 0.78116035
00:49:40.310 --> 00:49:41.270 I’m a pathologist,
NOTE Confidence: 0.78116035
00:49:41.270 --> 00:49:42.550 an immuno oncology researcher.
NOTE Confidence: 0.78116035
00:49:42.550 --> 00:49:44.626 I joined us an assistant professor
NOTE Confidence: 0.78116035
00:49:44.626 --> 00:49:46.634 and was appointed in 2015 and
NOTE Confidence: 0.78116035
00:49:46.634 --> 00:49:48.290 we have had a very active.
NOTE Confidence: 0.78116035
00:49:48.290 --> 00:49:50.530 I got any program actually look up today
NOTE Confidence: 0.78116035
00:49:50.530 --> 00:49:53.068 and we have 64 publications since 2015.
NOTE Confidence: 0.78116035
00:49:53.070 --> 00:49:56.067 More than 20 trainees and a lot of grants
NOTE Confidence: 0.78116035
00:49:56.067 --> 00:49:58.495 including a number of NIH and DoD grants.
So we have been VC. But it’s a.

It’s a great environment to be able to achieve this.

The other thing we have been focusing on is trying to enhance our capacity to do sort of further molecular analysis of samples, and we have implemented a lot of technology and we have implemented a lot of technology to be able to be ahead of the game, and now we’re trying with Dave Rim.

Actually, to move some of these technologies into the clinic with the goal of having diagnostics that no one else has in that we’re focusing on.
The other aspects of my function within the top program has been to oversee the biospecimen repository that was, as you mentioned, initiated by link to New Years ago, and we have been able to grow it at infrastructure and also be able to disseminate the samples and we have a very rich repository that I would love everyone to use at some point. And finally the other aspect of what I’ve been doing is after a lot of effort from Euro in Mario at Gaston Dave Ramon. Also, they’d have to.
We have created a platform that we can use to be able to use some of these molecular methods in the context of clinical trials and really learn from them. And over the years since 2015 we have actually been able to work with seven clinical trials, three of which are IIT’s and we have been collecting, processing and analyzing samples in ways that very few people can in the world. I’m hoping to have a, you know, learn from it and be able to go to the next stage.
so again, it has been busy.

It has been very happy,

very productive,

and I’m very proud of being part of

this team. Thank you.

Thanks for all you’ve done and all

the men tease know that I hope this is

coming out all the students and medical

students and fellows that are working

with these labs and the basic labs.

The clinical labs working between the

different areas of a few more minutes.

Vanna Dest, so operations and the

clinical lab and the nurse practitioners

I’m sitting up here because someone

is finishing up the clinic for me.
We were a team. We work together and that has been a glue.

Tell us a little bit about your thoughts about expanding thoracic cancer unit to all the different areas. With a multi modality flare. Avana Sir, so I’m the senior program manager of this Milo Aips and I’ve been here. It’s Milo and working as a thoracic oncology ATP since 2013. I do represent the patient care services on this thoracic oncology cabinet and the goal of patient care services.
which is directed by Kim Slusser.

Is really to advocate and to support for the growth of the Thoracic Oncology Center.

With that, we’re trying to improve the system issues workflow issues, providing the infrastructure that we need to expand and succeed, as well as continued recruitment in education.

It really takes a dedicated and experienced team to deliver this expert, compassionate care to our patients, and I have to echo what everyone else has been saying.

We have a very gifted team that is formed a multidisciplinary partnership.
Our services include surgical oncology, radiation oncology, medical oncology, pulmonary intervention, pulmonary screening, smoking cessation and our team is huge. I mean, as everyone has been saying, it really does take a village to make this work. It’s not just one particular Department or one particular specialty that makes it all happen. So our team is made up of physician and nursing leadership. Our providers, both physicians and the advanced
practice providers are new patient coordinators practice nurses. Our clinical trial team, which is outstanding. Our medical assistants and ambulatory care associates and the other partners of our team, which are the infusion nurses. I mean, they’re really with our patients side by side when it comes to other medical oncology patients. Pharmacy social work. Palliative care. The checkout people that people that are doing the financials radiology
00:53:44.324 --> 00:53:45.515 interventional radiology pathology

00:53:45.515 --> 00:53:47.500 laboratory in our clinical secretaries.

00:53:47.500 --> 00:53:48.160 I mean,

00:53:48.160 --> 00:53:50.800 we truly have a world class team and

00:53:50.875 --> 00:53:53.384 I’m really happy to be apart of it.

00:53:53.384 --> 00:53:54.040 I mean,

00:53:54.040 --> 00:53:56.336 I think our goal is really to bring

00:53:56.336 --> 00:54:01.234 what we have at smilow to all the

00:54:01.234 --> 00:54:03.523 other delivery networks and to make

00:54:03.523 --> 00:54:05.480 sure that we have that one signature

00:54:06.540 --> 00:54:08.130 Absolutely a fully integrated team

00:54:08.130 --> 00:54:10.045 and with the best innovation of

00:54:10.045 --> 00:54:11.689 science and technology and and now,

00:54:11.690 --> 00:54:13.508 I’m sorry I didn’t forget you.

0104
I was saving you for last.

So Sarah Goldberg is our research director and I still remember you’re here about eight years now, right? Sarah or so.

I still remember I was on a trip spending hours trying to recruit Sarah to get her to calm down Lincoln.

I really desperately wanted her to come from mass general and get a farmer.

So Sarah tell us a little bit about you know and I’d like to introduce Kuraan Jennifer too. About the the lung research team and how we meet in and how we’re staying on the cutting edge and
00:54:44.097 --> 00:54:45.927 some some some thoughts and then

00:54:45.927 --> 00:54:48.275 well then we’ll open for questions.

00:54:48.275 --> 00:54:48.750 Well

00:54:48.750 --> 00:54:49.362 thanks right?

00:54:49.362 --> 00:54:51.810 This is an amazing forum to bring everybody

00:54:51.866 --> 00:54:53.798 together and talk about our program.

00:54:53.800 --> 00:55:00.670 I’m Sarah Goldberg, a medical oncologist.

00:55:00.670 --> 00:55:02.967 from so many people in the group.

00:55:02.970 --> 00:55:05.562 We have this amazing team and I think

00:55:05.562 --> 00:55:08.017 so much of what many of us have.

00:55:08.020 --> 00:55:10.450 Not really all of us focus on is is

00:55:10.450 --> 00:55:12.250 advancing the care of patients with

00:55:12.250 --> 00:55:14.896 lung cancer and so much of that is
through clinical trials and basic translational research that helps inform our clinical trials and so. We've done so much over the last few years to improve the care of patients with lung cancer or targeted therapies have come so far. We have, you know, so many more therapies that we can offer. Patient Scott mention immune therapy were starting to understand resistance and how to overcome it and so now it’s really bringing that to the next level and advancing things even further. And so, as I mentioned, we have this amazing research team we meet.
We used to have one meeting a week and now we have so much to discuss. I think we're up to like 2-3 meetings a week where we all get together and discuss various aspects of our clinical research program. So huge driving forces behind that are key Republican Jennifer Pope from the Clinical Trials Office. And they've done so much to help us make our clinical trials of reality open up. You know, the best trials, I think for our patients and keep things running smoothly.
So I’m turning it over to them and tell us about what they do. OK, very good.

Once you go 1st Gen. Hi everybody, I’m Jennifer Pope. I am the clinical trials team manager for the Thoracic group and I’m relatively new to this team but not new to the clinical trials Office. And I am looking forward to continue to work with Doctor Gettinger and work more closely with Doctor Goldberg and hoping to bring some more trials open quicker and to try to find the best trials for the patients.
that we have across the network.

So looking forward to that.

Yeah, thanks for all you’ve done and will continue to do KERA.

Hi everyone, thank you for having me and your public.

I’ve been at Yale now for 12 years. This year, eight of which had been in the Clinical Trials Office and I’ve had the pleasure of working with many of those on the panel over the last several years. I’m currently one of the assistant Directors of clinical trials operations in the Clinical Trials Office,
under Director Joyce Tool.

So I’m responsible for the lung Melanoma, therapeutic radiology and head and neck disease teams from an operational compliance standpoint.

I work closely with the research team, the team leaders, managers, regulatory. Our hospital partners.

It really does take a village is so many of you have already said and I want to say to that the investment of the research team is really inspirational on this team. The Link team is fortunate to have some really incredible and veteran team members. They have two research nurses who
are as dedicated as they come. They’ve been here for years series who are dedicated to doing the right thing for the patients. Gen Pope, who’s new and who’s been an excellent addition to the team and I just want to really take time to recognize all of their efforts as well as our regulatory partners in our regulatory manager, Christine Lee. It really does take the hard work of everyone to make what we do possible. Thanks Kera Ed captain, I don’t know if you want to light
00:58:11.046 --> 00:58:12.900 up your camera, but I just want.
NOTE Confidence: 0.78598315
00:58:12.900 --> 00:58:15.388 I just thank you for all you do for
NOTE Confidence: 0.78598315
00:58:15.388 --> 00:58:16.973 for multiple teams with certainly
NOTE Confidence: 0.78598315
00:58:16.973 --> 00:58:19.287 the lung Groupon and the lung Spore.
NOTE Confidence: 0.78598315
00:58:19.290 --> 00:58:21.298 And if you are able to say a
NOTE Confidence: 0.78598315
00:58:21.298 --> 00:58:23.483 little bit about big data and how
NOTE Confidence: 0.78598315
00:58:23.483 --> 00:58:25.490 we’re using the database at Yale.
NOTE Confidence: 0.843073
00:58:27.770 --> 00:58:28.654 Hi Roy, I wasn’t expecting
NOTE Confidence: 0.843073
00:58:28.654 --> 00:58:29.534 to be on camera here.
NOTE Confidence: 0.843073
00:58:29.540 --> 00:58:30.779 I have the sun in my eyes
NOTE Confidence: 0.843073
00:58:30.779 --> 00:58:31.838 and I gotta get you in
NOTE Confidence: 0.843073
00:58:31.840 --> 00:58:32.368 front of me.
NOTE Confidence: 0.8308418
00:58:34.110 --> 00:58:35.916 Yeah, so Wade Schultz with the
NOTE Confidence: 0.8308418
00:58:35.916 --> 00:58:37.422 hospital has been working very
NOTE Confidence: 0.8308418
00:58:37.422 --> 00:58:38.930 hard to get his computational
NOTE Confidence: 0.8308418
00:58:38.930 --> 00:58:40.430 health platform up and running.
and I think we finally have. Have it to a point where we can start to use it with our science with our patients, so it should be exciting. He just gave a presentation last week on the new C bio portal implementation that he has there. So a lot of our data will be going into that system that we can, you know, sort of democratize our data for research purposes. So that should be good.

We have a few questions where we’re at time, but you know this is like having our first Cabinet meeting.
It’s great, so I’m going to say there are three great issues that we have to attack: tackle access, community, and impact. Now these are three things I’d love to see. This team really, really tackle. I’m noticing the last three or four minutes anyone from the panel want to give me some ideas, something that how we get it. How are we going to have even a bigger impact in our work? And how are we going to do seoi? Which is just so important?
Treat the people that live in our community and want to comment on that. In terms of clinical trials, we’ve done a lot of this over the last few years already, and I think it’s worked incredibly well where you showed our clinical trials numbers. I think we couldn’t do better, but we’ve been doing very well in trying to bring our trials to the community as much as possible and a huge part of that is, there’s. People in all of our care centers. Or maybe I’ll say most of our care.
01:00:15.200 --> 01:00:17.166 centers who really join in our weekly
NOTE Confidence: 0.7960199
01:00:17.166 --> 01:00:19.116 meetings and their part of the team
NOTE Confidence: 0.7960199
01:00:19.116 --> 01:00:21.028 they you know they give input on to
NOTE Confidence: 0.7960199
01:00:21.030 --> 01:00:22.822 what trials we should open and what
NOTE Confidence: 0.7960199
01:00:22.822 --> 01:00:24.948 would be good to have in the Community.
NOTE Confidence: 0.7960199
01:00:24.950 --> 01:00:26.750 And I think we all make every effort
NOTE Confidence: 0.7960199
01:00:26.750 --> 01:00:28.766 to open trials and bring the protocols
NOTE Confidence: 0.7960199
01:00:28.766 --> 01:00:30.689 to the care centers whenever we can,
NOTE Confidence: 0.7960199
01:00:30.690 --> 01:00:31.990 and when that’s not possible,
NOTE Confidence: 0.7960199
01:00:31.990 --> 01:00:33.880 I think having all the clinicians
NOTE Confidence: 0.7960199
01:00:33.880 --> 01:00:35.675 informed about what’s available at the
NOTE Confidence: 0.7960199
01:00:35.675 --> 01:00:37.127 main campus is also really important
NOTE Confidence: 0.7960199
01:00:37.127 --> 01:00:38.780 and we try to do that as well.
NOTE Confidence: 0.7960199
01:00:38.780 --> 01:00:40.800 So I think that brings.
NOTE Confidence: 0.7960199
01:00:40.800 --> 01:00:41.505 And best carrot,
NOTE Confidence: 0.7960199
01:00:41.505 --> 01:00:43.442 I think most of us agree is on a
NOTE Confidence: 0.7960199
01:00:43.442 --> 01:00:45.103 trial it to to the places where the
NOTE Confidence: 0.7960199
01:00:45.103 --> 01:00:46.790 patients are being treated and an if
NOTE Confidence: 0.7960199
01:00:46.790 --> 01:00:48.816 not bringing the patients to the trials.
NOTE Confidence: 0.870627
01:00:50.110 --> 01:00:52.540 Any other comments or thoughts?
NOTE Confidence: 0.870627
01:00:52.540 --> 01:00:53.708 Vinny, you’re in Bridgeport.
NOTE Confidence: 0.870627
01:00:53.708 --> 01:00:55.460 That’s an area that certainly I
NOTE Confidence: 0.870627
01:00:55.518 --> 01:00:57.006 would hope you’d want to reach
NOTE Confidence: 0.870627
01:00:57.006 --> 01:00:58.532 out to the community and help
NOTE Confidence: 0.870627
01:00:58.532 --> 01:01:00.230 people to navigate and get in. How
NOTE Confidence: 0.8672376
01:01:00.230 --> 01:01:01.290 you showed a picture.
NOTE Confidence: 0.8672376
01:01:01.290 --> 01:01:03.386 Yeah, I think you know you in
NOTE Confidence: 0.8672376
01:01:03.386 --> 01:01:04.997 your introductory you showed a picture.
NOTE Confidence: 0.8672376
01:01:05.000 --> 01:01:06.743 I think you were at a church
NOTE Confidence: 0.8672376
01:01:06.743 --> 01:01:08.180 or you were out there.
NOTE Confidence: 0.8672376
01:01:08.180 --> 01:01:10.028 You know getting to know the community,
and I think that’s you know, that’s one of the key things is in order to improve access, you have to get out their boots on the ground to understand what some of the obstacles are, what some of the knowledge deficits are. So you know, we’ve had. You know I’ve had a lot of you know, lunch meals that you know the, you’ve been fortunate enough to get out there pre covid to meet people, meet different primary care doctors. I’ve given a couple talks. One was at the home for the Brave, a place in Bridgeport that actually
houses homeless veterans to talk about lung cancer screening to kind of learn, not just give a talk, but to learn about, you know what the access issues are to get those folks plugged into our system, ’cause sometimes they. They just don’t know. There are still people in the community that think that the Yale is just down in New Haven and it’s getting out there to educate them that you know we’re right next door. You don’t have to go far, so that’s that’s one of the methods boots on the ground.
Hey, any other accounts, if they have one final question, I see Vince DVD on the line so we had a grand rounds three or four years ago when we talked about actions, disease and curing that can we cure lung cancer. What do people think, Scott? Depends on how you define cure, but yes. Radeker yes, I think so. In what way with chemo radiation or with the targeted therapies, the immunotherapy? I mean, I think ultimately we're going to turn this into a chronic disease, right? So you will see that over
the course of your careers, what do you think Katie from the lab? What’s the most exciting thing coming out of the lab? Well, I think we’re releasing some drugs that are now showing efficacy on some targets that have for a long time been thought to be undruggable targets, for example, like drugs that are targeting carass, which accounts for quite a large subset of lung cancers. And so when we start to see things like that. So our understanding and having drugs that can target these undruggable
targets an you add on to that then.
Other modalities of treating this disease and then bringing it into earlier stages and screening and detection.
I think we’re going to see even more improvements in survival than we have seen in the past few years. I agree we have to end, but Vince just run in the chat.
You already are in a few cases which coming from him means a lot. I think that we’re making a difference, but it only matters if we get access.
If we screen people and we find these mutations, we figure out how to treat resistance
and then of course immunotherapy. And we need to personalize that Kurt.
I think some of the work you’re doing, you know with all your quantitative unit chemistry with David and others that that perhaps could have our role there, correct?
Yeah, you know, I think Roy, I think that it’s critical to understand the patients better, not only have new drugs have being able to use the drugs in the right patient, and that I think is what we’re achieving and expanding, and that will certainly
contribute to better care.

Well, listen, it’s been a great panel and we’ve had our first Cabinet meeting in public and will do more of these. And we’re going to do this in other disease areas too. Thank you Kevin. We’re going to do this in other disease areas too. Thank you Kevin.

The goal is to raise the bar for patients. Uh, and do it. We have all the pieces in place at the center. We’re going to do this in other disease areas too. Thank you Kevin.

Best for all your help and inspiration to all the team. And really there are so many other people that aren’t on the panel that are part of this and we’re really thankful.
Thank you all and see you next week at grand rounds.

Thank you.
