Funding for Yale Cancer Answers is provided by Smilow Cancer Hospital.

Welcome to Yale Cancer answers with your host doctor in East JGP are Yale Cancer answers features the latest information on cancer care by welcoming oncologists and specialists who are on the forefront of the battle to fight cancer this week. It's a conversation about the molecular mechanisms of cancer with Doctor Daryl Klein. Doctor Klein is an assistant professor of pharmacology at the Yale School of Medicine, where Doctor Chad Power as a.
So Darrell maybe we can start off by you telling us a little bit more about yourself and what it is exactly that you do.

My path to become a medical researcher involves my personal backstory and my love of competition. In some ways, I feel like I've been destined to study kinases and cancer and their mechanisms and and with the hope of developing useful cancer therapeutics.

And my career trajectory if you will. As a medical scientist, began long before my formal training.
I grew up in New Jersey just outside of Philadelphia, and at a young age, my sister was diagnosed with MCL or chronic myeloid leukemia. Over 40 years ago, Peter Noel at the University of Pennsylvania in Philadelphia was studying the driving mutations that lead to CML. And he discovered a chromosome alteration that he dubbed the Philadelphia chromosome and my sister and the results...
of that change.

Is that a new protein is made a fusion of a tyrosine kinase signaling protein?

That’s that’s stuck in the on position, and that instructs cells to.

To divide and grow and thus cancer.

And that protein became a target for drug discovery and it really heralded the era of precision medicine that is specifically targeting a single. You know bad protein with a drug and that was really exciting.

And in 2001 there was this huge success with. The mat neighbor or Gleevec, and that became the first drug that was developed to target a
00:02:26.386 --> 00:02:28.109 specific kinase to treat a disease,
00:02:28.110 --> 00:02:30.170 and in this case, someone.
00:02:30.170 --> 00:02:33.110 And patients treated with this drug can
00:02:33.110 --> 00:02:36.290 live long lives with controlled disease.
00:02:36.290 --> 00:02:38.690 Unfortunately for you know, Kimberly,
00:02:38.690 --> 00:02:40.426 my sister, at that time it was.
00:02:40.430 --> 00:02:42.926 It was just the beginning of
00:02:42.926 --> 00:02:44.174 understanding this disease.
00:02:44.180 --> 00:02:45.560 And there were no therapeutics,
00:02:45.560 --> 00:02:46.700 and that meant you know,
00:02:46.700 --> 00:02:48.620 little could be done, and.
00:02:48.620 --> 00:02:50.867 In this powerlessness drives me to find
00:02:50.867 --> 00:02:53.351 ways to spare other families similar
00:02:53.351 --> 00:02:57.017 devastation and to better understand cancer.
00:02:57.020 --> 00:02:57.506 You know,
I really have spent a large part of my career investigating the molecular basis for oncogenic signaling. And you know on that path I attended the University of Pennsylvania for my undergrad in my PhD, and my medical degree, and I did clinical rotations at the Children’s Hospital of Philadelphia. So I was walking the same halls as Peter, Noel and my parents and my sister years before. I joined the MSTP or medical scientist training program and. This was funded by the NIH.
the National Institutes of Health, to grant to train a group of physicians, also to be researchers, and the goal of that program is basically to link basic science findings to the clinic. And I think the success of Leave Act was just the beginning of targeting kinases. These these tires and kinases other kinases and cancer. And so when I was at Penn, I studied under Professor Mark Lemon.
He was working on those other kinases that lead to different cancers. And you know, to see how they might cause cancer and how we might leverage understanding their mechanisms to develop new therapeutics. I also mentioned you know my my desire for you know competition. And when I first joined Mark’s
lab at Penn and was first introduced to lab research, I realized there that. Scientific researches is intensely competitive and I think it makes Olympic sport seem safe by comparison and I love that and I loved everything about that. And then the problem is in sensually in science. You’re competing with unknown competitors and an unknown number of teams and the rules of the game are undefined and you don’t even know when the conversation started. So,
and certainly your competitors have more money and resources than you do, so you’re always the underdog and that excites me and I like that. You know an example. When we started the project will chat more about in a little bit. We were certain that half a dozen other groups in the world were already working on it and we didn’t know how far along they were. And so all you know is what you don’t know. And if you want to win, you have to work nonstop like 24/7. I once spent 50 hours straight in the lab when I was a grad student without sleeping.
And then you know that was exciting to me.

That’s something you can’t do in sport after the game you go home, but science is a years long competition with no timeouts and the intensity is off the charts so.

I think that frames kind of why I became a medical researcher and why I love doing the work that I do.

So let’s take a step back for a bit. I mean, that sounds really inspiring and interesting in terms of how this kind of came full circle.

How you? Had this experience?
00:06:34.175 --> 00:06:36.753 with your sister and then went on
NOTE Confidence: 0.885244987777778
00:06:36.753 --> 00:06:38.961 to to become a scientist that’s
NOTE Confidence: 0.885244987777778
00:06:38.961 --> 00:06:41.157 hopefully making a difference in the
NOTE Confidence: 0.885244987777778
00:06:41.157 --> 00:06:43.245 lives of other patients like her.
NOTE Confidence: 0.885244987777778
00:06:43.250 --> 00:06:44.694 But for our audience,
NOTE Confidence: 0.885244987777778
00:06:44.694 --> 00:06:47.643 maybe you can take a step back and
NOTE Confidence: 0.885244987777778
00:06:47.643 --> 00:06:50.467 tell us exactly like what is a kinase
NOTE Confidence: 0.885244987777778
00:06:50.548 --> 00:06:53.390 and why are they important in cancer?
NOTE Confidence: 0.80161613
00:06:54.420 --> 00:06:55.578 Sure, sure, yeah.
NOTE Confidence: 0.80161613
00:06:55.578 --> 00:06:57.894 I mean I should also mention
NOTE Confidence: 0.80161613
00:06:57.894 --> 00:07:00.409 that while I trained as A and
NOTE Confidence: 0.80161613
00:07:00.409 --> 00:07:02.610 MDP MD PhD physician scientist,
NOTE Confidence: 0.80161613
00:07:02.610 --> 00:07:05.780 I’ve actually chosen a path
NOTE Confidence: 0.80161613
00:07:05.780 --> 00:07:08.142 devoted entirely to research.
NOTE Confidence: 0.80161613
00:07:08.142 --> 00:07:11.088 So during training, when I you know,
NOTE Confidence: 0.80161613
00:07:11.088 --> 00:07:12.723 find myself engaging with patients
and talking to them about the unfortunately limited treatment options I found that difficult and frustrating and all I wanted to do was rush back to the lab and find new potential therapeutic avenues. So I made a choice to devote myself entirely to lab work, but at the same time I'm still working with other physicians, scientists and clinicians to help bridge our discoveries. To the bedside. Kinases are often drivers of cancers and the one that I've
been working on recently ALK and a plastic lymphoma kinases is a well known cancer related protein. And much like the protein involved in my sister’s of Mle, it’s a tyrosine kinase and basically tyrosine kinases instruct the cells to grow and divide, if this is unregulated that leads to cancer. So ALK well, unlike the Siml case, ALK is a receptor tyrosine kinase. So what that means is ALK is located in a different part of the cell than the CML kinase. So if it if a cell were an ocean,
the CML kinase would be a submarine
and ALK would be more like an aircraft
carrier at the surface and so this.
Localization difference has therapeutic implications.
As you might imagine, you can’t target a submarine the same way you would target in an aircraft carrier.
So in the clinic we use small molecule.
You know missile like drugs that can dive deep into the ocean to reach that kinase. whereas for ALK we have an opportunity to use antibodies that can target it at the cell surface,
so more like a.
You know a B-52 bomber. It's been known for years that ALK is a driver of neuroblastoma. Now neuroblastoma is a cancer of the peripheral nervous system. It's one of the more common pediatric cancers that accounts for more than 10% of childhood cancer mortality. But clinically useful therapeutics have been slow to develop, and I think one of the key reasons for this slow development of treatments is likely the lack of a structural framework for the target alcc. Simply put, we have no idea what it
00:09:41.738 --> 00:09:43.538 looked like or how it functioned.

00:09:43.540 --> 00:09:47.185 It was a complete mystery before our work.

00:09:47.190 --> 00:09:50.853 I mean the fact that ALK is expressed on

00:09:50.853 --> 00:09:53.228 neuroblastoma cells but is not present.

00:09:53.230 --> 00:09:56.340 On healthy tissue makes Alka

00:09:56.340 --> 00:09:58.206 veritable oncogenic beacon.

00:09:58.210 --> 00:10:00.630 That’s a perfect target

00:10:00.630 --> 00:10:02.445 for precision medicine.

00:10:02.450 --> 00:10:04.405 It’s much like the novel

00:10:04.405 --> 00:10:05.969 fusion protein and kmle.

00:10:05.970 --> 00:10:09.720 In each case the protein.

00:10:09.720 --> 00:10:10.105 Specifically,

00:10:10.105 --> 00:10:12.415 if you’re targeting the protein specifically,

00:10:12.420 --> 00:10:14.328 it should have little side effects

00:10:14.328 --> 00:10:16.060 outside of the cancer itself.
And the hope is that if we can target this kinase alken neuroblastoma. That we might have the same positive outcomes for neuroblastoma that we see for patients with KMLE. So you know one of the things that always fascinates me is how you find these things to begin with. I mean, how do we know that these kinases play a role in cancer? How does that? How do you figure that out? How do you know which kinases are submarines and which kinases are our aircraft carriers, I mean. And how did you figure out that these were important anyways?
How does that happen?

That’s a good question.

That’s certainly outside of my lab’s expertise.

A lot of that is done through genomic work and associating certain genes with certain disease phenotypes, and so where my lab’s expertise comes in pretty much after the fact.

Once these associations are known.

That’s where we come in to help define bio physically and structurally, exactly how these kinases and uncle genes are acting, and hopefully if we have a molecular...
picture of that how we might design and develop therapeutics to. To stall that and prevent disease. So when you say that it kind of all starts with understanding what genes are expressed in what genes aren’t. I mean it, it sounds like the progress that we make in terms of cancer medicine is really investigators. Building on other investigators work. So somebody you know maybe was sequencing some genes and found that some genes were overexpressed in some cancers versus not. And then other people kind of discovered that gene was associated with a protein like.
A kinase and then you look at that kinase and say well where is it and how can we target it?

Is that kind of how that works?

That's exactly right, right? I mean, it's work of a tremendous number of individuals with differing expertise. Certainly the approach my lab takes is just one cog in that machine, one that is keenly important to understand the mechanism of how molecules work, and probably less than the discovery stage.
which can then give us insight into how we might target these and develop therapeutics.

And then the other question that I often have is, OK, so you know you discover this kinase and you discover that it’s important in cancer. Why is it that some kinases are important in some cancers but not in others? Why do you have these genes for these kinases to begin with? And why are they differentially expressed?

Cancer often recapitulates the paradigms that are important during development.
So all of these kinases are crucially important in the stages of development and help patterning and complex tissues. After that, they aren’t used so much in adulthood, and it’s only during cancer that a lot of these developmental pathways are reawakened, and they can be reawakened in different tissues and different places, but they all lead to the same thing. Basically once you turn a kinase on, the growth instructions are returned and the growth instructions and
when that’s not counterbalanced, that’s how cancer develops. Well, we’re going to take a short break for a medical minute, but when we come back, let’s learn more about the molecular mechanisms of cancer and how exactly we target these differentially expressed kinases to actually make a difference for patients, please stay tuned for more with my guest doctor Daryl Klein. funding for Yale Cancer Answers comes from Smilow Cancer Hospital with an event focused on nutrition for cancer survivorship presented by the Smilow.
Cancer Care Center in Trumbull.

April 14th Register at Yale Cancer Center.

Org or email cancer answers at Yale.

The American Cancer Society estimates that nearly 150,000 people in the US will be diagnosed with colorectal cancer this year alone. When detected, early colorectal cancer is easily treated and highly curable, and men and women over the age of 45 should have regular colonoscopies to screen for the disease. Patients with colorectal cancer have more hope than ever before, thanks to increased access to advanced
Clinical trials are currently underway at federally designated Comprehensive Cancer Centers. Such as Yale Cancer Center and its Milo Cancer Hospital to test innovative new treatments for colorectal cancer tumor. Gene analysis has helped improve management of colorectal cancer by identifying the patients most likely to benefit from chemotherapy and newer targeted agents, resulting in more patient specific treatment. More information is available at yalecancercenter.org you’re listening to Connecticut Public Radio.
Welcome back to Yale Cancer answers. This is doctor in East Egg part and I'm joined tonight by my guest doctor, Daryl Klein. We're learning more about the molecular mechanisms of cancer and right before the break Daryl was telling us about this profoundly inspiring story of his sister who is diagnosed with CML, which really started his journey on becoming a physician scientist, and one who is particularly interested in these molecules called kinases, which really work. To activate the growth of cancer.
cells and so you know Darrell before
NOTE Confidence: 0.895207821666667
the break you were mentioning that
NOTE Confidence: 0.895207821666667
eurolab really after we know that
NOTE Confidence: 0.895207821666667
you know a kinase is involved in a
NOTE Confidence: 0.895207821666667
particular cancer is really involved
NOTE Confidence: 0.895207821666667
in looking at its structure
NOTE Confidence: 0.895207821666667
and kind of how to target it.
NOTE Confidence: 0.895207821666667
Is that right?
NOTE Confidence: 0.895207821666667
Exactly,
NOTE Confidence: 0.904520128571429
my lab is a structural biology lab,
NOTE Confidence: 0.904520128571429
so you know, we’re sensually photographers.
NOTE Confidence: 0.904520128571429
But we take pictures of very tiny things, molecules and proteins,
NOTE Confidence: 0.904520128571429
and so this. Requires specialized
NOTE Confidence: 0.904520128571429
equipment cameras if you will.
NOTE Confidence: 0.904520128571429
That use X rays and electrons rather
than light in the visual spectrum that we’re used to. Uhm? You know, many people know. DNA, so let’s start there. People have heard of DNA and Watson and Crick and they’re double Helix. And DNA is basically a cookbook with 10s of thousands of recipes, mostly protein recipes, so I guess it’s a keto or Paleo cookbook. ALK is one of these recipes. And the recipe in the DNA cookbook tells us the ingredients and the order to make alcc. But one big problem with this DNA cookbook. Is it’s not illustrated,
So we have no idea what the final product will look like. So you know my lab follows the recipe to take pictures of the final products to illustrate this, this DNA cookbook. So we take molecular photographs of the protein and also the mutants that are found in cancer. And in these pictures give us a better understanding of how things supposed to look like and how it changes in cancer. And in this can inform us about approaches to. Designing targeted therapeutics. So my lab just reported the structure of the protein ALK in nature.
That’s the tyrosine kinase that’s important in neuroblastoma. And this gave us a first look at this unique uncle Gene and it’s, you know it’s going to be impossible for me to relay the complexities here. But if we stick to our Analogy of the the cell is an ocean, it’s. It’s not unreasonable to say that Alcc did actually look a bit like an aircraft carrier. I mean it had this. Unusual a long gated structure and it probably lies parallel to the to the surface, so it’s like an aircraft carrier floating on the water.
Or the surface of a cell.

And furthermore, we can see how it actually gets activated. Basically two of these aircraft carriers line up next to one another and in that position they’re then capable to sell to send their their growth signals, which ultimately end up being cancerous growth signals. To the neuroblastoma cell. Uncontrolled ALK activation like this leads to cancer and it and it results from the tumor continuing to express this developmental out gene along with its stimulatory ligand. Our research reveals an approach
to shutting off ALK and that it can be quite straightforward. Potentially if we use our structure as a blueprint, we can see clear areas where we would want to target this. This aircraft like molecule.

I mean there’s certain vulnerabilities that are revealed in the structure that we can strategically target and and you know sync this aircraft carrier, and so my lab now is designing potent antibodies. That specifically target these regions in ALK, and you know there’s small
molecules currently out there in use for.

Neuroblastoma, as well as many other
different cancers that are driven or
or partially dependent on kinases.
And compared to small molecule
therapeutics antibodies,
I think can offer a great benefit.
The small molecule drugs that
are now currently in use like
prison and learn Latin.
And one problem with these types of
inhibitors is that you can’t keep
fooling the cancer for very long.
They the cancer figures out this
NOTE Confidence: 0.7377237425
00:21:37.322 --> 00:21:39.446 trip quite fast that you’re trying
NOTE Confidence: 0.7377237425
00:21:39.446 --> 00:21:42.118 to inhibit it in this in this domain,
NOTE Confidence: 0.7377237425
00:21:42.120 --> 00:21:44.745 and they and the cancer makes changes
NOTE Confidence: 0.7377237425
00:21:44.745 --> 00:21:46.829 that diminish the drugs impact.
NOTE Confidence: 0.7377237425
00:21:46.830 --> 00:21:48.690 Whereas I think the antibody
NOTE Confidence: 0.7377237425
00:21:48.690 --> 00:21:51.599 approach is is a more brute
NOTE Confidence: 0.7377237425
00:21:51.599 --> 00:21:53.770 force approach and it’s harder for
NOTE Confidence: 0.7377237425
00:21:53.770 --> 00:21:55.270 the cancer to overcome this,
NOTE Confidence: 0.7377237425
00:21:55.270 --> 00:21:57.194 the strategy of inhibition.
NOTE Confidence: 0.7377237425
00:21:57.194 --> 00:22:00.080 I think the therapeutic future
NOTE Confidence: 0.7377237425
00:22:00.163 --> 00:22:02.373 will likely use a combination
NOTE Confidence: 0.7377237425
00:22:02.373 --> 00:22:08.660 of these two to completely.
NOTE Confidence: 0.7377237425
00:22:04.590 --> 00:22:08.660 Dismantle the out machinery.
NOTE Confidence: 0.7377237425
00:22:08.660 --> 00:22:10.940 In some ways you know cancer can be
NOTE Confidence: 0.7377237425
00:22:10.940 --> 00:22:13.157 feed viewed as having some of the
NOTE Confidence: 0.7377237425
similar challenges that we see for SARS, Co V2 and both use similar strategies to overcome disease. Both you know cancer and viruses mutate rapidly. And they can evolve to different inhibitor approaches. And just as we use antibodies through vaccination or or directly injecting recombinant antibodies and small molecules to overcome COVID. Now we have a new blueprint for ALK to help us overcome similar challenges that are encountered in in cancer and in particular neuroblastoma. And it sounds like when you know the the
structure of these aircraft carriers.

But you can be very specific about targeting those particular molecules as opposed to normal cells.

So you might have a bomber that only targets, a mechanism whereby these two aircraft carriers can’t line up together that really wouldn’t apply in any other situation, and you can try to get more precise or more targeted therapies.
That’s exactly right, and remember that I said that you know, since alpha is expressed only on neuroblastoma cells but not present on healthy tissue, it really makes targeting ALK the perfect for you know. Set up for precision medicine and then a layer on top of that, which I think you were just referring to is now that we know the detailed structure and blueprints of this. And that’s exactly what we’re trying to do. We’re trying to design antibodies that specifically block areas on the protein that are
involved in important for it’s activation.

That is precisely where the ligand binds to activate the receptor and getting back to how it’s activated.

Where we see the two molecules lining up side-by-side to each other, we’re designing antibodies that can block that interface to prevent it from being activated independent of ligand. Which could be caused by certain mutations, which is further research that we’re doing now or with the ligand. So we’re using all this information to specifically design antibodies.
that are tailored to this molecule and the type of mutations or mechanisms that activate it specifically in neuroblastoma.

And so as you design these antibodies in these treatments, you're doing that in the lab. How? How does it actually get into patients? How does it affect people like your sister? Because that's where the story really started and how long does that whole process take? You're right, that's a that's certainly a long process and you know.

Cancer Research is so matured and specialized now that it really requires
you know effort to put these discoveries into usable formats and for others to build upon and meaningful ways.

And just as the NIH created that MSTP program to link basic science and patient Care now I think we need similar links between basic science researchers.

I mean, the you know RNA biologist and chromosome researcher and. And in the biophysicist like me trying to link up with the model Organism biologist to test the a lot of these and preclinical setups.

We all speak a different scientific dialect and we have different perspectives,
so you know how do we work together

and in one answer to that is is,

you know being part of the Yale Cancer Biology Institute that I’m a part of.

You know we really bring together desperate researchers among those interested in cancer.

And so you know now I have and and colleagues that I can work with that can bring our developing antibodies quite rapidly to see if they do. So good activity in vivo and then that hopefully can be rapidly leveraged
into reaching the patients that desperately need these treatments. Sounds very much like you had mentioned earlier, but this is kind of a microcosm for the macrocosm of how science works, that your lab puts together. People who all kind of come at the problem of ALK from a slightly different vantage point. But the work in your lab kind of builds on the work of other people’s labs, and so maybe in the last few minutes that we have, you could tell us kind of a little bit about.
How that works in the grand scheme of things? I mean, it sounds like. One of the things that we’ve realized with the pandemic is that the world is shrinking, and hopefully the scientific discovery from one lab to another kind of. Bounces around fairly easily. How does that collaboration work? I think it is. It is certainly a challenge and I think you know getting researchers to talk to each other and work together is an important part of that. And like you said, I think you know during the pandemic and having people communicate in different ways like we are now through zoom and other things.
00:28:08.850 --> 00:28:11.424 Maybe the world is shrinking a bit and I
00:28:11.424 --> 00:28:13.944 think that’s a good thing for science and
00:28:13.944 --> 00:28:16.520 that’s a good thing for research because.
00:28:16.520 --> 00:28:19.472 Of course, all of us working
00:28:21.440 --> 00:28:23.169 We don’t want them to go unnoticed
00:28:23.169 --> 00:28:25.033 by the people next in that chain
00:28:25.033 --> 00:28:26.373 that you were talking about.
00:28:26.380 --> 00:28:28.495 That’s necessary to make the
00:28:28.495 --> 00:28:30.610 leap to bring these discoveries
00:28:30.683 --> 00:28:32.867 to their therapeutic potential.
00:28:33.480 --> 00:28:35.670 Doctor Daryl Klein is an assistant
00:28:35.670 --> 00:28:37.130 professor of pharmacology at
00:28:37.195 --> 00:28:38.820 the Yale School of Medicine.
00:28:38.820 --> 00:28:40.852 If you have questions,
the address is canceranswers@yale.edu

and past editions of the program are available in audio and written.

F arm at yalecancercenter.org.

We hope you’ll join us next week to learn more about the fight against cancer here on Connecticut Public

radio funding for Yale Cancer Answers
