00:00:00.000 --> 00:00:02.154 Funding for Yale Cancer Answers is provided by Smilow Cancer Hospital.

00:00:06.410 --> 00:00:08.954 Welcome to Yale Cancer Answers with your host doctor in East JGP are Yale Cancer Answers features the latest information on cancer care by welcoming oncologists and specialists who are on the forefront of the battle to fight cancer this week.

00:00:13.488 --> 00:00:15.771 It’s a conversation about the molecular mechanisms of cancer with Doctor Daryl Klein.

00:00:25.490 --> 00:00:27.744 Doctor Klein is an assistant professor of pharmacology at the Yale School of Medicine.

00:00:30.030 --> 00:00:32.076 where Doctor Chad Power as a
professor of surgical oncology.

So Darrell maybe we can start off by you telling us a little bit more about yourself and what it is exactly that you do.

Yeah, I mean I think. My path to become a medical researcher involves my personal back story and my love of competition. In some ways, I feel like I’ve been destined to study kinases and cancer and their mechanisms and and with the hope of developing useful cancer therapeutics. And my career trajectory if you will. As a medical scientist, began long before my formal training.
00:01:10.100 --> 00:01:12.724 I grew up in New Jersey just outside
00:01:12.724 --> 00:01:14.840 of Philadelphia, and at a young age.
00:01:14.840 --> 00:01:18.466 My my sister was diagnosed with cancer.
00:01:18.470 --> 00:01:21.300 Kimberly, my sister, was diagnosed
00:01:21.300 --> 00:01:25.050 with MLE or chronic myeloid leukemia.
00:01:25.050 --> 00:01:28.230 It’s a blood cancer that’s rare
00:01:28.230 --> 00:01:30.565 in children at that time.
00:01:30.565 --> 00:01:35.468 Over 40 years now,
00:01:35.468 --> 00:01:37.835 Peter Noel at the University of
00:01:37.835 --> 00:01:40.873 Pennsylvania in Philadelphia was studying
00:01:40.873 --> 00:01:43.142 the driving mutations that lead to CML.
00:01:43.142 --> 00:01:45.437 And he discovered a chromosome alteration
00:01:45.437 --> 00:01:47.243 that he dubbed the Philadelphia
00:01:47.243 --> 00:01:49.770 chromosome and kmle patients,
00:01:49.770 --> 00:01:52.026 like my sister and and the results
of that change.

Is that a new protein is made a fusion of a tyrosine kinase signaling protein?

That’s that’s stuck in the on position, and that instructs cells to.

To divide and grow and thus cancer. And that protein became a target for drug discovery and it really heralded the era of precision medicine that is specifically targeting a single. You know bad protein with a drug and that that was really exciting.

And in 2001 there was this huge success with. The mat neighbor or Gleevec, and that became the first drug that was developed to target a
specific kinase to treat a disease, and in this case, someone. And patients treated with this drug can live long lives with controlled disease. Unfortunately for you know, Kimberly, it was the beginning of understanding this disease. And there were no therapeutics, and that meant you know, little could be done, and. In this powerlessness drives me to find ways to spare other families similar devastation and to better understand cancer. You know,
I really have spent a large part of my career investigating the molecular basis for, and you know on that path I attended the University of Pennsylvania for my undergrad in my PhD, and my medical degree, and I did clinical rotations at the Children’s Hospital of Philadelphia. So I was walking the same halls as Peter, Noel and my parents and my sister years before. I joined the MSTP or medical Scientist training program and. This was funded by the NIH.
the National Institutes of Health, to grant to train a group of physicians, also to be researchers, and the goal of that program is basically to link basic science findings to the clinic. The bench to the bedside and to Brig lab progress into useful therapeutics as rapidly as possible. And I think the success of Leave Act was just the beginning of targeting kinases. These these tires and kinases other kinases and cancer. And so when I was at Penn, I studied under Professor Mark Lemon.
He was working on those other kinases that lead to different cancers. And you know, to see how they might cause cancer and how we might leverage understanding their mechanisms to develop new therapeutics.

I also mentioned you know my desire for competition. And I, you know, grew up playing sports in college and I love competing and track and field and crew and football and baseball. And when I first joined Mark's
00:04:46.397 --> 00:04:48.056 lab at Penn and and was first
00:04:48.056 --> 00:04:49.199 introduced to lab research,
00:04:49.200 --> 00:04:51.408 I realized there that.
00:04:51.410 --> 00:04:53.246 Scientific researches is intensely
00:04:53.246 --> 00:04:56.467 competitive and I think it makes Olympic
00:04:56.467 --> 00:04:59.255 sport seem safe by comparison and and I
00:04:59.255 --> 00:05:02.500 love that and I loved everything about that.
00:05:02.500 --> 00:05:04.852 And then the problem is in
00:05:04.852 --> 00:05:06.028 sensually in science.
00:05:06.030 --> 00:05:08.042 You’re competing with unknown
00:05:08.042 --> 00:05:10.606 competitors and and an unknown number
00:05:11.142 --> 00:05:13.685 of of teams and and the rules of the
00:05:13.685 --> 00:05:15.957 game are undefined and you don’t even
00:05:15.957 --> 00:05:17.937 know when the conversation started.
00:05:17.940 --> 00:05:18.302 So,
and certainly your competitors have more money and resources than you do, so you’re always the underdog and that excites me and I like that. You know an example. When we started the project we were certain that half a dozen other groups in the world were already working on it and we didn’t know how far along they were. And so all you know is what you don’t know. And if you want to win, you have to work nonstop like 24/7. I once spent 50 hours straight in the lab when I was a grad student without sleeping.
And then you know that was exciting to me. That’s something you can’t do in sport after the game you go home, but science is a years long competition with no timeouts and the intensity is off the charts so. I think that that frames kind of. Why I became a medical researcher and why? Why I love doing the work that I do. So let’s take a step back for a bit. I mean, that sounds really inspiring and interesting in terms of how this kind of came full circle. How you? Had this experience
00:06:34.175 --> 00:06:36.753 with your sister and then went on
NOTE Confidence: 0.885244987777778
00:06:36.753 --> 00:06:38.961 to to become a scientist that’s
NOTE Confidence: 0.885244987777778
00:06:38.961 --> 00:06:41.157 hopefully making a difference in the
NOTE Confidence: 0.885244987777778
00:06:41.157 --> 00:06:43.245 lives of other patients like her.
NOTE Confidence: 0.885244987777778
00:06:43.250 --> 00:06:44.694 But for our audience,
NOTE Confidence: 0.885244987777778
00:06:44.694 --> 00:06:47.643 maybe you can take a step back and
NOTE Confidence: 0.885244987777778
00:06:47.643 --> 00:06:50.467 tell us exactly like what is a kinase
NOTE Confidence: 0.885244987777778
00:06:50.548 --> 00:06:53.390 and why are they important in cancer?
NOTE Confidence: 0.80161613
00:06:54.420 --> 00:06:55.578 Sure, sure, yeah.
NOTE Confidence: 0.80161613
00:06:55.578 --> 00:06:57.894 I mean I should also mention
NOTE Confidence: 0.80161613
00:06:57.894 --> 00:07:00.409 that while I trained as A and
NOTE Confidence: 0.80161613
00:07:00.409 --> 00:07:02.610 MDP MD PhD physician scientist,
NOTE Confidence: 0.80161613
00:07:02.610 --> 00:07:05.780 I’ve actually chosen a path
NOTE Confidence: 0.80161613
00:07:05.780 --> 00:07:08.142 devoted entirely to research.
NOTE Confidence: 0.80161613
00:07:08.142 --> 00:07:11.088 So during training, when I you know,
NOTE Confidence: 0.80161613
00:07:11.088 --> 00:07:12.723 find myself engaging with patients
and talking to them about the unfortunately limited treatment options I, I found that difficult and frustrating and all I wanted to do was rush back to the lab and find new potential therapeutic avenues. So I made a choice to devote myself entirely to lab work, but at the same time I'm still working with other physicians, scientists and clinicians to help bridge our discoveries. Kinases are often drivers of cancers and the one that I've
been working on recently ALK and a plastic lymphoma kinases is a well known cancer related protein. And much like the protein involved in my sisters of Mle, it’s a tyrosine kinase and basically tyrosine kinases instruct the cells to grow and divide, and if this is unregulated that leads to cancer. So ALK well, unlike the Siml case, ALK is located in a different part of the cell than the CML kinase.

Is A is a receptor tyrosine kinase. So what that means is ALK is located in a different part of the cell than the CML kinase.
the CML kinase would be a submarine and ALK would be more like an aircraft carrier at the surface and so this. Localization difference has therapeutic implications.

As you might imagine, you can’t target a submarine the same way you would target in an aircraft carrier. So in the clinic we use small molecule. You know missile like drugs that can dive deep into the ocean to reach that kinase whereas for ALK we have an opportunity to use antibodies that can target it at the cell surface, so more like a.
You know a B52 bomber. It's been known for years that ALK is a driver of neuroblastoma. Now neuroblastoma is a cancer of the peripheral nervous system. It's one of the more common pediatric cancers that accounts for more than 10% of childhood cancer mortality. But clinically useful therapeutics have been slow to develop, and I think you know one of the key reasons for this slow development of treatments is likely the lack of a structural framework for the target Alk. Simply put, we have you know no idea what it
looked like or how it functioned.

It was a complete mystery before our work. I mean the fact that ALK is expressed on neuroblastoma cells but is not present. On healthy tissue makes Alka a veritable oncogenic beacon. That's a perfect target for precision medicine. It's much like the novel fusion protein and kmle. In each case the protein. Specifically, if you’re targeting the protein specifically, it should have little side effects outside of the cancer itself.
And the hope is that if we can target this kinase alken neuroblastoma. That we might have the same positive outcomes for neuroblastoma that we see for patients with KMLE. So you know one of the things that always fascinates me is how you find these things to begin with. How do we know that these kinases play a role in cancer? How does that? How do you figure that out? How do you know which kinases are submarines and which kinases are our aircraft carriers, I mean.
How does that happen?

That’s a good question.

That’s certainly outside of my lab’s expertise.

A lot of that is done through genomic work and associating certain genes with certain disease phenotypes, and so where my lab’s expertise comes in pretty much after the fact. Once these associations are known, that’s where we come in to help define bio physically and structurally, exactly how these kinases and uncle genes are acting, and hopefully if we have a molecular...
picture of that how we might design and develop therapeutics to. To stall that and prevent disease. So when you say that it starts with understanding what genes are expressed in what genes aren’t. I mean it, it sounds like the progress that we make in terms of cancer medicine is really investigators. Building on other investigators’ work. So somebody you know maybe was sequencing some genes and found that some genes were overexpressed in some cancers versus not. And then other people kind of discovered that that gene was associated with a protein like.
A kinase and then you look at that kinase and say well where is it and how can we target it? Is that kind of how that works? That’s exactly right, right? I mean, it’s work of a tremendous number of individuals with differing expertise. Certainly the approach my lab takes is just one cog in that machine, one that’s a bit further down, and probably less than the discovery stage. But one that is keenly important to understand the mechanism of how molecules work,
which can then give us insight into how we might target these and develop therapeutics. Around their function. And then the other question that I often have is. OK, so you know you discover this kinase and you discover that it’s important in cancer. Why is it that some kinases are important in some cancers but not in others? Why do you have these genes for these kinases to begin with? And why are they differentially expressed? Cancer often recapitulates the paradigms important and during development.
So all of these kinases are crucially important in the stages of development and help patterning and complex tissues. After that, they are not used so much in adulthood, and it’s only during cancer that a lot of these developmental pathways are reawakened, and they can be reawakened in different tissues and different places, but they all lead to the same thing. Basically once you turn on a kinase on your turning on the growth instructions and
when that’s not counterbalanced, that’s how cancer develops. Well, we’re going to take a short break for a medical minute, but when we come back, let’s learn more about the molecular mechanisms of cancer and how exactly we target these differentially expressed kinases to actually make a difference for patients, please stay tuned for more with my guest doctor Daryl Klein.

funding for Yale Cancer Answers comes from Smilow Cancer Hospital with an event focused on nutrition for cancer survivorship presented by the Smilow
Cancer Care Center in Trumbull.

April 14th Register at Yale Cancer Center.

Org or email cancer answers at Yale.

The American Cancer Society estimates that nearly 150,000 people in the US will be diagnosed with colorectal cancer this year alone.

When detected, early colorectal cancer is easily treated and highly curable, and men and women over the age of 45 should have regular colonoscopies to screen for the disease.

Patients with colorectal cancer have more hope than ever before, thanks to increased access to advanced...
therapies and specialized care.

Clinical trials are currently underway at federally designated Comprehensive Cancer Centers. Such as Yale Cancer Center and its Milo Cancer Hospital to test innovative new treatments for colorectal cancer tumor. Gene analysis has helped improve management of colorectal cancer by identifying the patients most likely to benefit from chemotherapy and newer targeted agents, resulting in more patient specific treatment.

More information is available at yalecancercenter.org.
Welcome back to Yale Cancer answers. This is doctor in East Egg part and I'm joined tonight by my guest doctor, Daryl Klein. We're learning more about the molecular mechanisms of cancer and right before the break Daryl was telling us about this profoundly inspiring story of his sister who is diagnosed with CML, which really started his journey on becoming a physician scientist, and one who is particularly interested in these molecules called kinases, which really work. To activate the growth of cancer.
cells and so you know Darrell before
NOTE Confidence: 0.895207821666667
the break you were mentioning that
NOTE Confidence: 0.895207821666667
eurolab really after we know that
NOTE Confidence: 0.895207821666667
you know a kinase is involved in a
NOTE Confidence: 0.895207821666667
particular cancer is really involved
NOTE Confidence: 0.895207821666667
in looking at its its structure
NOTE Confidence: 0.895207821666667
and kind of how to target it.
NOTE Confidence: 0.895207821666667
Is that right?
NOTE Confidence: 0.895207821666667
Exactly,
NOTE Confidence: 0.904520128571429
my lab is a structural biology lab,
NOTE Confidence: 0.904520128571429
so you know, we’re sensually photographers.
NOTE Confidence: 0.904520128571429
But we take pictures of of very,
NOTE Confidence: 0.904520128571429
very tiny things, molecules and proteins,
NOTE Confidence: 0.904520128571429
and so this. Requires specialized
NOTE Confidence: 0.904520128571429
equipment cameras if you will.
NOTE Confidence: 0.904520128571429
That use X rays and electrons rather
than light in the visual spectrum that we're used to. Uhm? You know, many people know.

DNA, so let's start there. People have heard of DNA and Watson and Crick and they're double Helix. And DNA is basically a cookbook with 10s of thousands of recipes, mostly protein recipes, so I guess it's a keto or Paleo cookbook. ALK is one of these recipes. And the recipe in the DNA cookbook tells us the ingredients and the order to make alcc. But one big problem with this DNA cookbook. Is it's not illustrated,
so we have no idea what the final product will look like.

So you know my lab follows the recipe to take pictures of the final products to illustrate this, this DNA cookbook.

So we take molecular photographs of the protein and also the mutants that are found in cancer.

And in these pictures give us a better understanding of how things supposed to look like and how it changes in cancer.

And in this can inform us about approaches to designing targeted therapeutics.

So my lab just reported the structure of the protein ALK in nature.
That’s the tyrosine kinase that’s important in neuroblastoma. And this gave us a first look at this unique uncle Gene and it’s, you know it’s going to be impossible for me to relay the complexities here. But if we stick to our Analogy of the the cell is an ocean, it’s. It’s not unreasonable to say that Alcc did actually look a bit like an aircraft carrier. I mean it had this. Unusual a long gated structure and it probably lies parallel to the to the surface, so it’s like an aircraft carrier floating on the water.
Or the surface of a cell.

And and furthermore, we can see how it actually gets activated. Basically two of these aircraft carriers line up next to one another and in that position they’re then capable to sell to send their their growth signals, which ultimately end up being cancerous growth signals. To the neuroblastoma cell. Uncontrolled ALK activation like this leads to cancer and it and it results from the tumor continuing to express this developmental out gene along with its stimulatory ligand. Our research reveals an approach.
to shutting off ALK and that it can be quite straightforward. Potentially if we use our structure as a blueprint, we can see clear areas where we would want to target this. This aircraft like molecule. I mean there’s certain vulnerabilities that are revealed in the structure that we can strategically target and and you know sync this aircraft carrier, and so my lab now is designing potent antibodies. That specifically target these regions in ALK, and you know there’s small
molecules currently out there in use for.

NOTE Confidence: 0.7377237425

Neuroblastoma, as well as many other

NOTE Confidence: 0.7377237425

different cancers that are driven or

NOTE Confidence: 0.7377237425

or partially dependent on kinases.

NOTE Confidence: 0.7377237425

And compared to small molecule

NOTE Confidence: 0.7377237425

therapeutics antibodies,

NOTE Confidence: 0.7377237425

I think can offer a great benefit.

NOTE Confidence: 0.7377237425

The small molecule drugs that

NOTE Confidence: 0.7377237425

are now currently in use like

NOTE Confidence: 0.7377237425

prison and learn Latin.

NOTE Confidence: 0.7377237425

They target the intracellular.

NOTE Confidence: 0.7377237425

The actual kinase domain of the protein out.

NOTE Confidence: 0.7377237425

And one problem with these types of

NOTE Confidence: 0.7377237425

inhibitors is that you can’t keep

NOTE Confidence: 0.7377237425

fooling the cancer for very long.

NOTE Confidence: 0.7377237425

They the cancer figures out this
00:21:37.322 --> 00:21:39.446 trip quite fast that you’re trying

00:21:39.446 --> 00:21:42.118 to inhibit it in this in this domain,

00:21:42.120 --> 00:21:44.745 and they and the cancer makes changes

00:21:44.745 --> 00:21:46.829 that diminish the drugs impact.

00:21:46.830 --> 00:21:48.690 Whereas I think the antibody

00:21:48.690 --> 00:21:51.599 approach is is is a more brute

00:21:51.599 --> 00:21:53.770 force approach and it’s harder for

00:21:53.770 --> 00:21:55.270 the cancer to overcome this,

00:21:55.270 --> 00:21:57.194 the strategy of inhibition.

00:21:57.194 --> 00:22:00.080 I think the the therapeutic future

00:22:00.163 --> 00:22:02.373 will likely use a combination

00:22:02.373 --> 00:22:04.583 of these two to completely.

00:22:04.590 --> 00:22:08.660 Dismantle the the out machinery.

00:22:08.660 --> 00:22:10.940 In some ways you know cancer can be

00:22:10.940 --> 00:22:13.157 feed viewed as having some of the
similar challenges that we see for SARS, Co V2 and both use similar strategies to overcome disease. Both you know cancer and viruses mutate rapidly. And they can evolve to different inhibitor approaches. And just as we use antibodies through vaccination or or directly injecting recombinant antibodies and small molecules to overcome COVID. Now we have a new blueprint for ALK to help us overcome similar challenges that are encountered in in cancer and in particular neuroblastoma. And it sounds like when you know the the
structure of these aircraft carriers.

But you can be very specific about targeting those particular molecules as opposed to normal cells.

So you might have a bomber that only targets, a mechanism whereby these two aircraft carriers can’t line up together that really wouldn’t apply in any other situation, so you can try to get more precise or more targeted therapies.

Is that right?
That’s exactly right, and remember that I said that you know, since alpha is expressed only on neuroblastoma cells but not present on healthy tissue, it really makes targeting ALK the perfect for you know. Set up for precision medicine and then a layer on top of that, which I think you were just referring to is now that we know the detailed structure and blueprints of this. And that’s exactly what we’re trying to do. We’re trying to design antibodies that specifically block areas on the protein that are
involved in important for it’s activation.
That is precisely where the ligand binds to activate the receptor and getting back to how it’s activated.
Where we see the two molecules lining up side-by-side to each other, we’re designing antibodies that can block that interface to prevent it from being activated independent of ligand. Which could be caused by certain mutations, which is further research that we’re doing now or with the ligand. So we’re using all this information to specifically design antibodies.
that are tailored to this molecule
NOTE Confidence: 0.931961159090909
and the type of mutations
NOTE Confidence: 0.931961159090909
or mechanisms that activate it
NOTE Confidence: 0.931961159090909
specifically in neuroblastoma.
NOTE Confidence: 0.913035372
And so as you design these
NOTE Confidence: 0.913035372
antibodies in these treatments,
NOTE Confidence: 0.913035372
you're doing that in the lab. How?
NOTE Confidence: 0.913035372
How does it actually get into patients?
NOTE Confidence: 0.913035372
How does it affect people like your sister?
NOTE Confidence: 0.913035372
Because that's where the story
NOTE Confidence: 0.913035372
really started and how long
NOTE Confidence: 0.913035372
does that whole process take?
NOTE Confidence: 0.796460149
You're right, that's a that's certainly
NOTE Confidence: 0.796460149
is a long process and you know
NOTE Confidence: 0.796460149
Cancer Research is so matured and
NOTE Confidence: 0.796460149
specialized now that it really requires
you know effort to put these discoveries into usable formats and for others to build upon and meaningful ways. And just as the NIH created that MSTP program to link basic science and patient care now I think we need similar links between basic science researchers. I mean, the you know RNA biologist and chromosome researcher and. And in the biophysicist like me trying to link up with the model. Organism biologist to test the a lot of these and preclinical setups. We all speak a different scientific dialect and we have different perspectives,
so you know how do we work together
and in one answer to that is is,
you know being part of the Yale Cancer Biol Biology Institute that I’m a part of.
You know we we really bring together desperate researchers among those interested in cancer.
And so you know now I have and and being a physician scientist so you know now there’s a cohort of people and colleagues that I can work with that can bring our developing antibodies that we have into preclinical testing quite rapidly to see if they do.
So good activity in vivo and then that hopefully can be rapidly leveraged
NOTE Confidence: 0.796460149
00:26:50.430 --> 00:26:53.169 into reaching the the patients that
NOTE Confidence: 0.796460149
00:26:53.169 --> 00:26:55.180 desperately need these treatments.
NOTE Confidence: 0.90850388875
00:26:56.680 --> 00:26:58.490 Sounds very much like you
NOTE Confidence: 0.90850388875
00:26:58.490 --> 00:26:59.576 had mentioned earlier,
NOTE Confidence: 0.90850388875
00:26:59.580 --> 00:27:02.396 but this is kind of a microcosm for
NOTE Confidence: 0.90850388875
00:27:02.396 --> 00:27:04.680 the macrocosm of how science works,
NOTE Confidence: 0.90850388875
00:27:04.680 --> 00:27:06.960 that that your lab puts together.
NOTE Confidence: 0.90850388875
00:27:06.960 --> 00:27:09.284 People who all kind of come at
NOTE Confidence: 0.90850388875
00:27:09.284 --> 00:27:12.099 the problem of of ALK from a
NOTE Confidence: 0.90850388875
00:27:12.099 --> 00:27:13.835 slightly different vantage point.
NOTE Confidence: 0.90850388875
00:27:13.840 --> 00:27:17.574 But the work in your lab kind of builds
NOTE Confidence: 0.90850388875
00:27:17.574 --> 00:27:19.800 on the work of other people’s labs,
NOTE Confidence: 0.90850388875
00:27:19.800 --> 00:27:22.572 and so maybe in in the last
NOTE Confidence: 0.90850388875
00:27:22.572 --> 00:27:24.580 few minutes that we have,
NOTE Confidence: 0.90850388875
00:27:24.580 --> 00:27:26.810 you could tell us kind of a little bit about.
NOTE Confidence: 0.90850388875
How that works in the grand scheme of things?

I mean, it sounds like.

One of the things that we’ve realized with the pandemic is that the world is shrinking, and hopefully the scientific discovery from one lab to another kind of bounces around fairly easily.

How does that collaboration work?

I think it is. It is certainly a challenge and I think you know getting researchers to talk to each other and work together is an important part of that. And like you said, I think you know during the pandemic and having people communicate in different ways like we are now through zoom and other things.
Maybe the world is shrinking a bit and I think that’s a good thing for science and that’s a good thing for research because. Of course, all of us working independently and making advances. We don’t want them to go unnoticed by the people next in that chain that you were talking about. That’s necessary to make the leap to bring these discoveries to their therapeutic potential. Doctor Daryl Klein is an assistant professor of pharmacology at the Yale School of Medicine. If you have questions,
