The Cancer of the Pancreas Screening-5 Study

Study Purpose

The purpose of the study is to annually survey people at increased risk of developing pancreatic cancer with a combination of high resolution MRI or CT imaging of the pancreas, as well as endoscopic ultrasound imaging of the pancreas. The goal of the study is to identify early pancreatic cancer or precancerous lesions in high risk individuals. In addition to annual imaging surveillance, a blood sample will be collected to assist in the development of non-invasive early pancreatic cancer blood test.

Eligibility

- Strong family history of pancreas cancer
- Inherited germline mutation associated with pancreas cancer (e.g. BRCA2/1, PALB2, ATM, p16/CDKN2A (FAMMM), Lynch Syndrome)
- Peutz-Jegher Syndrome (STK11)
- Hereditary Pancreatitis (PRSS1/2, CTRC, CFTR)
