The Smilow Multidisciplinary Pain Program is available for patients with complex and difficult to manage cancer-related pain. Our multidisciplinary team includes experts from Pain Medicine, Interventional Radiology, Palliative Care, and Integrative Medicine specialties to provide integrative pain medicine for patients who suffer from pain as a result of their cancer treatments including radiation, chemotherapy, surgery, and pain caused by the disease itself.

Our Program offers a variety of pain management options. Treatment may include oral pain medications or interventional procedures, such as trigger point injections and nerve blocks. The pain medicine team also offers implanted pumps that deliver pain medications directly to the source of pain in the body.

All of our physicians work together to provide comprehensive care to our patients. Our nurse practitioner is certified in Pain Management by the American Nursing Credentialing Center.
